

Free PDF Quiz 2025 High Hit-Rate CheckPoint 156-587 Valid Test Tips

BTW, DOWNLOAD part of iPassleader 156-587 dumps from Cloud Storage: <https://drive.google.com/open?id=1M0DZBIMtnC1BcKxOAr5NT463IKxtr3xB>

Our 156-587 exam questions have been designed by the experts after an in-depth analysis of the exam and the study interest and hobbies of the candidates. You avail our 156-587 study guide in three formats, which can easily be accessed on all digital devices without any downloading any additional software. And they are also auto installed. It is very fast and convenient. Our 156-587 learning material carries the actual and potential exam questions, which you can expect in the actual exam.

CheckPoint 156-587 Exam Syllabus Topics:

Topic	Details
Topic 1	Advanced Gateway Troubleshooting: This section of the exam measures the skills of Check Point Network Security Engineers and addresses troubleshooting techniques specific to gateways. It includes methods for diagnosing connectivity issues and optimizing gateway performance.
Topic 2	Advanced Management Server Troubleshooting: This section of the exam measures the skills of Check Point System Administrators and focuses on troubleshooting management servers. It emphasizes understanding server architecture and diagnosing problems related to server performance and connectivity.

Topic 3	Advanced Troubleshooting with Logs and Events: This section of the exam measures the skills of Check Point Security Administrators and covers the analysis of logs and events for troubleshooting. Candidates will learn how to interpret log data to identify issues and security threats effectively.
Topic 4	Advanced Identity Awareness Troubleshooting: This section of the exam measures the skills of Check Point Security Consultants and focuses on troubleshooting identity awareness systems.
Topic 5	Advanced Site-to-Site VPN Troubleshooting: This section of the exam measures the skills of Check Point System Administrators and covers troubleshooting site-to-site VPN connections.

Dear candidates, have you thought to participate in any CheckPoint 156-587 exam training courses? In fact, you can take steps to pass the certification. iPassleader CheckPoint 156-587 Exam Training materials bear with a large number of the exam questions you need, which is a good choice. The training materials can help you pass the certification.

CheckPoint Check Point Certified Troubleshooting Expert - R81.20 Sample Questions (Q52-Q57):

NEW QUESTION # 52

You receive reports that Users cannot browse internet sites. You are using identity awareness with AD Query and Identity Collector in addition you have the Browser Based Authentication Enabled. What command can be used to debug the problem?

- A. on the gateway: ad query debug on
- B. on the management: ad query debug extended
- C. on the gateway: ad debug on
- D. on the gateway: pdp debug nac extended

Answer: D

Explanation:

Identity Awareness is a feature that enables the Security Gateway to identify users and groups behind IP addresses, and apply security policies based on their identity¹². Identity Awareness uses different methods to acquire identities, such as AD Query, Identity Collector, and Browser-Based Authentication¹². To debug Identity Awareness issues, you need to use the command `pdp debug on` on the gateway, where `pdp` stands for Policy Decision Point, the component that handles the identity acquisition and enforcement¹³. The command `pdp debug` has different flags for different identity sources, such as `adlog` for AD Query, `ic` for Identity Collector, and `nac` for Browser-Based Authentication¹³. The flag `extended` enables more detailed debug output¹³. Therefore, the correct command to debug the problem of users not being able to browse internet sites with Identity Awareness using AD Query, Identity Collector, and Browser-Based Authentication is `pdp debug nac extended` on the gateway¹³. The other options are incorrect because they either use the wrong command (`ad debug` instead of `pdp debug`), the wrong flag (`ad query` instead of `nac`), or the wrong location (on the management instead of on the gateway). NEW QUESTION # 53

What process monitors, terminates, and restarts critical Check Point processes as necessary?

- A. FWM
- B. CPM
- C. FWD
- D. CPVVD

Answer: D

NEW QUESTION # 54

What version of Check Point can Security Gateways begin dynamically distributing Logs between log servers?

- A. R81
- B. R77
- C. R30
- D. R75

Answer: A

Explanation:

Dynamic log distribution is a feature that allows the Security Gateway to distribute logs between the active Log Servers, instead of sending a copy of every log to each Log Server. This feature was introduced in Check Point R81.10 version, and it requires both the Management and the Gateways to be at least on version R81.10 for this to be supported¹². With dynamic log distribution, the Gateway can optimize the disk space usage and network bandwidth consumption of the Log Servers, and also improve the performance and reliability of the logging system³. References: Dynamic logs distribution - Check Point CheckMates¹, (CCTE) - Check Point Software², SmartLog and SmartEvent R81.10 Administration Guide³

NEW QUESTION # 55

When a user space process or program suddenly crashes, what type of file is created for analysis

- A. coredebug
- B. core dump
- C. core analyzer
- D. kernel_memory_dump dbg

Answer: B

Explanation:

When a user space process crashes unexpectedly, the operating system often creates a core dump file. This file is a snapshot of the process's memory at the time of the crash, including information such as:

- * Program counter: This indicates where the program was executing when it crashed.
- * Stack pointer: This shows the function call stack, which can help trace the sequence of events leading to the crash.
- * Memory contents: This includes the values of variables and data structures used by the process.
- * Register values: This shows the state of the processor registers at the time of the crash.

Core dump files can be analyzed using debuggers like GDB to understand the cause of the crash.

Why other options are incorrect:

- * B. kernel_memory_dump dbg: This refers to a kernel memory dump, which is generated when the operating system kernel itself crashes.
- * C. core analyzer: This is a tool used to analyze core dump files, not the file itself.
- * D. coredebug: This is not a standard term for any type of crash dump file.

Check Point Troubleshooting References:

Check Point's documentation mentions core dumps in the context of troubleshooting various processes, such as fwd (firewall) and cpd (Check Point daemon). You can find information on enabling core dumps and analyzing them in the Check Point administration guides and knowledge base articles.

NEW QUESTION # 56

What information does the doctor-log script supply?

- A. Repair options. Logging Rates, Logging Directories
- B. Logging errors. Exceptions, Repair options
- C. Current and daily average logging rates. Indexing status, Size
- D. Logging rates, Logging Directories, List of troubleshooting tips

Answer: C

Explanation:

The doctor-log script is a tool that provides information about the logging system and helps to identify and troubleshoot common issues. The script runs automatically every night and generates a report that contains the following information:

* Current and daily average logging rates: This shows how many logs are being generated and received by the log server per second. It can help to monitor the logging performance and identify any spikes or drops in the logging rate.

* Indexing status: This shows the status of the log indexing process, which enables faster and more efficient log searches. It can help to identify any issues with the indexing system, such as delays, failures, or errors.

* Size: This shows the size of the log files and the disk space used by the logging system. It can help to manage the disk space and plan for log rotation and backup.

The doctor-log script also provides some troubleshooting tips and repair options for common logging issues, such as corrupted log files, missing log indexes, or low disk space. The script can be run manually or scheduled to run at a specific time. The script output can be viewed in the SmartConsole or in the log server file system.
