Supermicro MI300X Expert (SMI300XE) Certification Exam Sample

Questions (Q27-Q32):

NEW QUESTION # 27

Which two situations could occur if you forcefully shift the release lever without first unlocking the red lock?(Choose 2 answers.)

- A. The power supply unit will fail.
- B. All the answers are correct.
- C. You could permanently damage the lock on the power supply unit.
- D. The power supply unit can no longer be secured into the tray.

Answer: A,C

Explanation:

For Supermicro MI300X GPU systems, removing the power supply unit (PSU) improperly can lead to serious issues.

* Why the red lock exists?

* The red locking mechanism ensures that the PSU is properly secured in the system.

* Before disengaging the PSU, the red lock must first be unlocked to avoid damage.

* If you forcefully shift the release lever without unlocking the red lock:

* B: The power supply unit will fail# If the PSU is removed improperly, it can cause internal damage to power connectors, resulting in PSU failure or improper functioning.

* C: You could permanently damage the lock on the power supply unit# The locking mechanism is designed for smooth disengagement. Forcefully shifting the lever can break or warp the lock, making it impossible to secure the PSU back in place.

* Incorrect Answers Explained:

* A (All answers are correct)# This is incorrect because not all answers are valid.

* D (The PSU can no longer be secured into the tray)# This happens only if the lock is damaged, which is covered under option C.

Supermicro's official documentation clearly states that unlocking the red lock first is a critical step before removing or replacing the PSU.

NEW QUESTION # 28

What will happen when you pull the GPU tray out partially?

- A. The tray will vibrate three times, alerting the user that it is released from the rail mechanism and is ready to be lifted, then start flashing a red light.
- B. The tray will start becoming very hot.
- C. The tray will lock to prevent it from pulling too fast, and 1 person on each side of the tray needs to press down on the lever to unlock it.
- D. The tray will start spewing liquid everywhere.

Answer: C

Explanation:

When the GPU tray is pulled out partially, it locks in place to prevent accidental removal or dropping. To fully remove it, two people must press down on the lever on each side before continuing.

* Option A (Correct): The tray locks automatically to ensure safe removal, and two people are needed to press the unlock levers.

* Option B (Incorrect): The tray does not vibrate or flash red when released.

* Option C (Incorrect): The tray does not contain liquid components.

* Option D (Incorrect): The tray does not generate excessive heat upon removal.

NEW QUESTION # 29

Which 2 ROCm commands should you run to gather AMD GPU information from the server?

- A. sudo rocm-smi -a, and sudo rocm-smi
- B. sudo rocm-gpu, sudo rocm-baseboardgpu
- C. sudo rocm-csv, and sudo rocm-amd.bug.txt
- D. sudo rockm-smc, and sudo rockm-bug.report.txt

Answer: A

Explanation:

The ROCm System Management Interface (rocm-smi) is the recommended tool for gathering AMD GPU information from the server.

* Option D (Correct):

* sudo rocm-smi -a displays all available GPU information.

* sudo rocm-smi shows basic GPU stats.

* Option A (Incorrect): These are not valid ROCm commands.

* Option B (Incorrect): "rocm-smc" and "rocm-bug-report.txt" do not exist in ROCm.

* Option C (Incorrect): "rocm-gpu" and "rocm-baseboardgpu" are not standard AMD diagnostic commands.

NEW QUESTION # 30

What is the executable file extension used in Windows for SUM?

- A. .txt
- B. .exe
- C. binary
- D. .sh

Answer: B

Explanation:

This question is a duplicate of Question No. 20. The correct Windows executable file extension for SUM is .exe.

* Option A (Correct): SUM on Windows is executed using .exe.

* Option B (Incorrect): .sh is a script file format for Linux, not Windows.

* Option C (Incorrect): .txt files contain text and cannot execute commands.

* Option D (Incorrect): "binary" is not a valid file extension for SUM execution on Windows.

NEW QUESTION # 31

The ROCm commands are not providing output or are failing. What could be the primary reason why?

And how can you validate the reasoning?

- A. If more than 3 GPUs are missing, then ROCm commands will not function. We need to verify that the 3 are missing in the IPMI GUI and review the GPU component section to make sure that at least 2 or fewer GPUs are missing.
- B. CPU is not installed correctly on the server. Review the OS dmesg logs for any odd CPU messages, then if located proceed to reseat the CPU.
- C. You suspect there are GPUs not detected. To determine which GPUs are missing, open the IPMI GUI and review the GPU component section to make sure all GPUs are present.
- D. The GPU baseboard may not be detected. You can determine this by opening the IPMI GUI and reviewing the FW section.

Answer: C

Explanation:

If ROCm commands fail to provide output, the primary issue is likely missing or undetected GPUs. The best way to validate this is by checking the IPMI GUI and reviewing the GPU component section to ensure that all GPUs are present.

* Option A (Correct): Missing GPUs are the most common cause of ROCm failures. The IPMI GUI provides visibility into which GPUs are detected.

* Option B (Incorrect): CPU misalignment would cause general system failure, not ROCm-specific issues.

* Option C (Incorrect): The GPU baseboard status can be checked in IPMI but is not the primary cause of ROCm failures.

* Option D (Incorrect): ROCm can function with multiple missing GPUs, but the key issue is confirming GPU presence first.
