

Free PDF Quiz 2025 Updated JN0-637: Security, Professional (JNCIP-SEC) Excellect Pass Rate

Owing to our high-quality JN0-637 real dump sand high passing rate, our company has been developing faster and faster and gain good reputation in the world. Our education experts are adept at designing and researching exam questions and answers of JN0-637 study materials. What's more, we can always get latest information resource. Our high passing rate is the leading position in this field. We are the best choice for candidates who are eager to Pass JN0-637 Exam and acquire the certification.

DumpsKing is a leading provider of top-quality Security, Professional (JNCIP-SEC) (JN0-637) preparation material for the JN0-637 test. Our Security, Professional (JNCIP-SEC) (JN0-637) exam questions are designed to help customers get success on the first try. These latest Juniper JN0-637 Questions are the result of extensive research by a team of professionals with years of experience.

Reliable JN0-637 - Security, Professional (JNCIP-SEC) Excellect Pass Rate

Our company has been putting emphasis on the development and improvement of JN0-637 test prep over ten year without archaic content at all. So we are bravely breaking the stereotype of similar content materials of the exam, but add what the exam truly tests into our JN0-637 Exam Guide. So we have adamant attitude to offer help rather than perfunctory attitude. We esteem your variant choices so all these versions of JN0-637 study materials are made for your individual preference and inclination.

Juniper Security, Professional (JNCIP-SEC) Sample Questions (Q41-Q46):

NEW QUESTION # 41

An ADVPN configuration has been verified on both the hub and spoke devices and it seems fine. However, OSPF is not functioning as expected.

```

[edit protocols ospf]
user@ADVFN-HUB# show
area 0.0.0.0 {
    interface st0.0 {
        demand-circuit;
    }
    interface ge-0/0/3.0 {
        passive;
    }
}

```

Referring to the exhibit, which two statements under interface st0.0 on both the hub and spoke devices would solve this problem? (Choose two.)

- A. passive
- B. interface-type p2p
- C. interface-type p2mp
- D. dynamic-neighbors

Answer: C,D

Explanation:

For ADVFN with OSPF, using a point-to-multipoint (p2mp) interface type and enabling dynamic- neighbors are crucial. This configuration allows dynamic discovery of neighbors and the establishment of tunnels. For more information, refer to Juniper ADVFN Configuration Guide.

In the ADVFN configuration, OSPF isn't functioning as expected due to the interface configuration on st0.0.

NEW QUESTION # 42

You are asked to detect domain generation algorithms

Which two steps will accomplish this goal on an SRX Series firewall? (Choose two.)

- A. Define an advanced-anti-malware policy under [edit services].
- B. Define a security-metadata-streaming policy under [edit
- C. Attach the security-metadata-streaming policy to a security
- D. Attach the advanced-anti-malware policy to a security policy.

Answer: A,D

NEW QUESTION # 43

You are configuring an interconnect logical system that is configured as a VPLS switch to allow two logical systems to communicate.

Which two parameters are required when configuring the logical tunnel interfaces? (Choose two.)

- A. The virtual tunnel interfaces should only be configured with two logical unit pairs per logical system interconnect.
- B. The logical tunnel interfaces should be configured with two logical unit pairs per logical system interconnect.
- C. Encapsulation ethernet must be used.
- D. Encapsulation ethernet-vpls must be used.

Answer: B,D

Explanation:

Explanation:

NEW QUESTION # 44

You are asked to set up advanced policy-based routing.

Which type of routing instance is designed to support this scenario?

- A. virtual switch
- B. non-forwarding
- **C. forwarding**
- D. virtual router

Answer: C

Explanation:

Comprehensive Detailed Step-by-Step Explanation with All Juniper Security References Understanding Advanced Policy-Based Routing (APBR):

- * APBR: Allows routing decisions based on application-level information and policies.
- * Objective: Direct specific application traffic through different paths based on policies.

Routing Instances in Junos OS:

- * Forwarding Instance:
 - * Used for features like filter-based forwarding (FBF) and APBR.
 - * Provides a separate forwarding table but shares the global routing table.
 - * Supports APBR.
- * Virtual Router:
 - * Provides a separate routing table and forwarding table.
 - * Used for logical separation of routing domains.
 - * Does not support APBR directly.
- * Virtual Switch:
 - * Operates at Layer 2.
 - * Used for VLAN separation and Layer 2 switching.
 - * Not applicable to routing or APBR.
- * Non-Forwarding Instance:
 - * Used for management purposes.
 - * Does not forward transit traffic.
 - * Not suitable for APBR.
- * Option A: forwarding
- * Correct.
- * A forwarding routing instance is specifically designed to support advanced policy-based routing.
- * It allows the SRX device to direct traffic based on policies to different forwarding instances.

NEW QUESTION # 45

Which two security intelligence feed types are supported?

- **A. custom feeds**
- B. Command and Control feed
- **C. infected host feed**
- D. malicious URL feed

Answer: A,C

Explanation:

The two security intelligence feed types that are supported are:

A) Infected host feed. An infected host feed is a security intelligence feed that contains the IP addresses of hosts that are infected by malware or compromised by attackers. The SRX Series device can download the infected host feed from the Juniper ATP Cloud or generate its own infected host feed based on the detection events from IDP. The SRX Series device can use the infected host feed to block or quarantine the traffic to or from the infected hosts based on the security policies¹.

B) Command and Control feed. A command and control feed is a security intelligence feed that contains the IP addresses of servers that are used by malware or attackers to communicate with infected hosts.

The SRX Series device can download the command and control feed from the Juniper ATP Cloud or generate its own command and control feed based on the detection events from IDP. The SRX Series device can use the command and control feed to block or log the traffic to or from the command and control servers based on the security policies².

The other options are incorrect because:

C) Custom feeds. Custom feeds are not a security intelligence feed type, but a feature that allows you to create your own security intelligence feeds based on your own criteria and sources. You can configure custom feeds by using the Junos Space Security

Director or the CLI. Custom feeds are not supported by the Juniper ATP Cloud or the IDP3.

D) Malicious URL feed. Malicious URL feed is not a security intelligence feed type, but a feature that allows you to block or log the traffic to or from malicious URLs based on the security policies. The SRX Series device can download the malicious URL feed from the Juniper ATP Cloud or the Juniper Threat Labs. Malicious URL feed is not supported by the IDP4.
