**Lesson 1: Firewalls Quiz Answers**

**Question 1: Which type of firewall was the first generation of firewalls?**

- Packet filter
- Application layer
- Next-generation firewall (NGFW)
- Stateful

**Question 2: Complete the sentence: A packet filter firewall controls network traffic based on \_\_\_\_\_.**

- network addresses, protocols, and ports.
- the behavior of the network connections.
- filtering layers 2-7 of the OSI model.
- application behavior or characteristics.

**Question 3: What was a limitation of first-generation firewalls?**

- Granular policy capability made managing the firewall too complex
- Produced many false positives, thereby overwhelming IT security
- **Opened random ports and used multiple connections**
- Filtered only at Layer 3 of the OSI model

**Question 4: Which identifying feature differentiates an NGFW firewall from earlier types of firewalls?**

- Filters by protocol
- Examines data in the packets
- **Uses rule-based decision-making**
- Monitors IP addresses and ports

**Question 5: In a UTM firewall, which component monitors protocols, such as FTP and HTTP?**

- Protocol filter
- Transport layer filter

## Fortinet EMEA Advanced Support Exam Sample Questions (Q22-Q27):

### NEW QUESTION # 22

How many layers does the OSI Model contain?

- A. 0
- B. 1
- **C. 2**
- D. 3

**Answer: C**

Explanation:

The OSI (Open Systems Interconnection) model consists of seven layers: Physical, Data Link, Network, Transport, Session, Presentation, and Application. This framework is used in Fortinet documentation to explain protocol operations. Options A, C, and D are incorrect as they do not match the standard OSI model.

Exact extract: "The OSI model defines seven layers for network communication: 1. Physical, 2. Data Link, 3. Network, 4. Transport, 5. Session, 6. Presentation, 7. Application."

### NEW QUESTION # 23

A Company is running an outdated version of a Webserver software that is vulnerable to multiple code execution and injection attacks. Which Security feature can protect the Webserver until the security patches are applied?

- **A. Intrusion Prevention System**
- B. Intrusion Detection System
- C. Anti-virus Protection
- D. Anti rootkit Protection

**Answer: A**

Explanation:

An Intrusion Prevention System (IPS) actively blocks malicious traffic, such as code execution or injection attacks, by matching against known signatures or anomalies, protecting the webserver until patches are applied. Intrusion Detection System (IDS) only detects and alerts, not blocks. Anti-virus and anti-rootkit are less effective for web-based attacks. The original document's answer B is incorrect, as IDS does not prevent attacks. Exact extract: "IPS provides active protection by blocking malicious traffic based on signatures or anomaly detection... Unlike IDS, which only detects and alerts, IPS can drop packets to prevent attacks like code execution or SQL injection."

### NEW QUESTION # 24

Link aggregation allows network devices to \_\_\_\_\_

- A. None of the above
- B. Increase bandwidth of an interface
- **C. Increase bandwidth by binding physical interfaces into a single channel**
- D. Restrict the bandwidth

**Answer: C**

Explanation:

Link aggregation, also known as IEEE 802.3ad or 802.1ax, enables the binding of multiple physical interfaces to form a single logical interface, which increases the overall bandwidth and provides redundancy. This is achieved by combining the bandwidth of the individual links into one aggregated link. For example, if two 1Gbps interfaces are aggregated, the logical link can provide up to 2Gbps bandwidth. This configuration is commonly used in

FortiGate devices to enhance network performance without replacing hardware. The option B correctly describes this by stating "Increase bandwidth by binding physical interfaces into a single channel," which aligns with the official description. Incorrect options include A, which is vague and does not specify the method of binding multiple interfaces; C, which is the opposite of the purpose; and D, which is invalid.

Exact extract: Link aggregation (IEEE 802.3ad/802.1ax) enables you to bind two or more physical interfaces together to form an aggregated (combined) link. This new link ... Link aggregation combines multiple physical interfaces into a single logical interface, increasing bandwidth and link redundancy. Traffic is distributed evenly.

#### NEW QUESTION # 25

Which command would you use to verify the status of an IPsec VPN tunnel on a FortiGate?

- A. diagnose vpn tunnel list
- B. diagnose ipsec status
- C. get vpn ipsec status
- D. show crypto ipsec sa

**Answer: A**

Explanation:

The 'diagnose vpn tunnel list' command on FortiGate displays detailed status information about IPsec VPN tunnels, including phase 1 and phase 2 states, uptime, and traffic statistics. Options B, C, and D are not valid FortiGate commands for this purpose. Exact extract: "Use diagnose vpn tunnel list to view the status of IPsec VPN tunnels, including phase 1 and phase 2 details, such as SA status, uptime, and traffic counters."

#### NEW QUESTION # 26

In a FortiGate high availability (HA) cluster, what happens if the primary unit fails?

- A. The cluster switches to active-passive mode
- B. Traffic is rerouted through an external gateway
- C. The cluster is disabled, and traffic stops
- D. A secondary unit takes over as the primary unit

**Answer: D**

Explanation:

In a FortiGate HA cluster (active-active or active-passive), if the primary unit fails, a secondary unit automatically takes over as the primary, ensuring continuity of traffic with minimal disruption. Option A is incorrect as traffic continues, C is incorrect as the mode doesn't change post-failure, and D is unrelated. Exact extract: "In a FortiGate HA cluster, if the primary unit fails, a secondary unit is elected as the new primary, taking over all roles to maintain traffic flow and session continuity."
