Amazon AWS Certified Solutions Architect - Associate (SAA-C02) Sample Questions (Q221-Q226):

NEW QUESTION # 221

A company has an existing on-premises three-tier web application. The Linux web servers serve content from a centralized file share on a NAS server because the content is refreshed several times a day from various sources. The existing infrastructure is not optimized and the company would like to move to AWS in order to gain the ability to scale resources up and down in response to load. On-premises and AWS resources are connected using AWS Direct Connect.

How can the company migrate the web infrastructure to AWS without delaying the content refresh process?

- A. Create an on-premises file gateway using AWS Storage Gateway to replace the NAS server and replicate content to AWS. On the AWS side, mount the same Storage Gateway bucket to each web server Amazon EC2 instance to serve the content.
- B. Create web server Amazon EC2 instances on AWS in an Auto Scaling group. Configure a nightly process where the web

server instances are updated from the NAS server.

- C. Create a cluster of web server Amazon EC2 instances behind a Classic Load Balancer on AWS. Share an Amazon EBS volume among all instances for the content. Schedule a periodic synchronization of this volume and the NAS server.
- D. Expose an Amazon EFS share to on-premises users to serve as the NAS server. Mount the same EFS share to the web server Amazon EC2 instances to serve the content.

Answer: C

NEW QUESTION # 222

A company stores multiple Amazon Machine Images (AMIs) in an AWS account to launch its Amazon EC2 instances. The AMIs contain critical data and configurations that are necessary for the company's operations.

The company wants to implement a solution that will recover accidentally deleted AMIs quickly and efficiently.

Which solution will meet these requirements with the LEAST operational overhead?

- A. Upload the AMIs to an Amazon S3 bucket that has Cross-Region Replication.
- B. Create a retention rule in Recycle Bin.
- C. Create Amazon Elastic Block Store (Amazon EBS) snapshots of the AMIs. Store the snapshots in a separate AWS account.
- D. Copy all AMIs to another AWS account periodically.

Answer: B

Explanation:

Recycle Bin is a data recovery feature that enables you to restore accidentally deleted Amazon EBS snapshots and EBS-backed AMIs. When using Recycle Bin, if your resources are deleted, they are retained in the Recycle Bin for a time period that you specify before being permanently deleted. You can restore a resource from the Recycle Bin at any time before its retention period expires. This solution has the least operational overhead, as you do not need to create, copy, or upload any additional resources. You can also manage tags and permissions for AMIs in the Recycle Bin. AMIs in the Recycle Bin do not incur any additional charges.

NEW QUESTION # 223

A company hosts an application on AWS Lambda functions that are invoked by an Amazon API Gateway API. The Lambda functions save customer data to an Amazon Aurora MySQL database. Whenever the company upgrades the database, the Lambda functions fail to establish database connections until the upgrade is complete. The result is that customer data is not recorded for some of the event. A solutions architect needs to design a solution that stores customer data that is created during database upgrades. Which solution will meet these requirements?

- A. Increase the run time of the Lambda functions to the maximum. Create a retry mechanism in the code that stores the customer data in the database.
- B. Store the customer data in an Amazon Simple Queue Service (Amazon SQS) FIFO queue. Create a new Lambda function that polls the queue and stores the customer data in the database.
- C. Provision an Amazon RDS proxy to sit between the Lambda functions and the database. Configure the Lambda functions to connect to the RDS proxy.
- D. Persist the customer data to Lambda local storage. Configure new Lambda functions to scan the local storage to save the customer data to the database.

Answer: B

Explanation:

RDS proxy can improve application availability in such a situation by waiting for the new database instance to be functional and maintaining any requests received from the application during this time. The end result is that the application is more resilient to issues with the underlying database.

This will enable solution to hold data till the time DB comes back to normal. RDS proxy is to optimally utilize the connection between Lambda and DB. Lambda can open multiple connection concurrently which can be taxing on DB compute resources, hence RDS proxy was introduced to manage and leverage these connections efficiently.

NEW QUESTION # 224

A company's web application consists of an Amazon API Gateway API in front of an AWS Lambda function and an Amazon DynamoDB database. The Lambda function handles the business logic, and the DynamoDB table hosts the data. The application uses Amazon Cognito user pools to identify the individual users of the application. A solutions architect needs to update the application so that only users who have a subscription can access premium content.

- A. Implement API usage plans and API keys to limit the access of users who do not have a subscription.
- B. Enable API caching and throttling on the API Gateway API
- C. Set up AWS WAF on the API Gateway API Create a rule to filter users who have a subscription
- **D. Apply fine-grained IAM permissions to the premium content in the DynamoDB table**

Answer: D

NEW QUESTION # 225

A company is developing a real-time multiplayer game that uses UDP for communications between the client and servers. In an Auto Scaling group, spikes in demand are anticipated during the day, so the game server platform must adapt accordingly. Developers want to store gamer scores and other non-relational data in a database solution that will scale without intervention. Which solution should a solutions architect recommend?

- A. Use Amazon Route 53 for traffic distribution and Amazon Aurora Serverless for data storage
- B. Use a Network Load Balancer for traffic distribution and Amazon Aurora Global Database for data storage
- C. Use an Application Load Balancer for traffic distribution and Amazon DynamoDB global tables for data storage
- **D. Use a Network Load Balancer for traffic distribution and Amazon DynamoDB on-demand for data storage**

Answer: D
