As practice makes perfect, we offer three different formats of CTFL-AT exam study material to practice and prepare for the CTFL-AT exam. Our ISQI CTFL-AT practice test simulates the real ISTQB Certified Tester - Foundation Level Extension - Agile Tester (CTFL-AT) exam and helps applicants kill exam anxiety. These CTFL-AT practice exams provide candidates with an accurate assessment of their readiness for the CTFL-AT test.

The CTFL-AT certification exam is based on the ISTQB Agile Tester Extension syllabus, which provides a comprehensive framework for agile testing. CTFL-AT exam consists of 40 multiple-choice questions, and candidates have 60 minutes to complete it. The passing score for the exam is 65%, and candidates who pass the exam receive the CTFL-AT certification. ISTQB Certified Tester - Foundation Level Extension - Agile Tester certification is valid for five years, after which candidates must recertify to maintain their certification.

The CTFL-AT Certification Exam covers a range of topics related to agile testing, including the fundamental principles of agile software development, the agile testing process, and the roles and responsibilities of team members in an agile project. It also covers topics such as test-driven development, continuous integration, and test automation. CTFL-AT exam consists of 40 multiple-choice questions and has a duration of 60 minutes. A passing score of 65% is required to earn the certification.

## Free PDF Quiz CTFL-AT - ISTQB Certified Tester - Foundation Level Extension - Agile Tester Perfect Exam Guide Materials

The ISTQB Certified Tester - Foundation Level Extension - Agile Tester (CTFL-AT) PDF dumps are suitable for smartphones, tablets, and laptops as well. So you can study actual ISTQB Certified Tester - Foundation Level Extension - Agile Tester (CTFL-AT) questions in PDF easily anywhere. BraindumpQuiz updates ISTQB Certified Tester - Foundation Level Extension - Agile Tester (CTFL-AT) PDF dumps timely as per adjustments in the content of the actual ISQI CTFL-AT exam.

### ISQI ISTQB Certified Tester - Foundation Level Extension - Agile Tester Sample Questions (Q38-Q43):

#### NEW QUESTION # 38

You are working in a software development company which, for many years, used a sequential development model and was organized into separate departments for each functional group (e.g. business analysts, developers, testers) located within their own office space. Your organization has recently changed to a SCRUM agile framework. Which of the following is an important organizational and behavioral best practice for a tester in the SCRUM team that should have also been practiced when using the sequential model?

- A. Co-located teamwork means that all team members, including developers and testers, must sit together in the same office, so they can quickly communicate face-to-face.
- B. Resilient testing means that the testing process is capable of dealing with rapid changes throughout the development process with test plans being updated during each iteration.
- C. Credibility means that the tester must share information with the stakeholders about the test process so that they find the selected test strategy and testing activities trustworthy.
- D. Cross-functional teamwork means that all team members contribute to testing in various ways. For example, involving people with the test strategy, test planning and execution as well as test reporting.

**Answer: D**

Explanation:

Cross-functional teamwork is an important organizational and behavioral best practice for a tester in the SCRUM team that should have also been practiced when using the sequential model. Cross-functional teamwork means that all team members, regardless of their functional roles, collaborate and share their skills and knowledge to achieve a common goal. In the context of testing, this means that testing is not seen as a separate activity or phase, but as an integral part of the development process. All team members contribute to testing in various ways, such as:

\* Involving people with the test strategy, test planning and execution as well as test reporting. This can help ensure that the testing activities are aligned with the business objectives, the user needs, and the technical requirements. It can also help improve the test coverage, the test quality, and the test efficiency.

\* Sharing the responsibility for testing among the team members. This can help reduce the workload and the dependency on a single tester or a testing team. It can also help increase the feedback and the communication among the team members, and foster a culture of quality and learning.

\* Leveraging the diverse skills and perspectives of the team members. This can help enhance the test design and the test execution by applying different techniques, tools, and approaches. It can also help identify and address the risks, the issues, and the opportunities for improvement from various angles. #### NEW QUESTION # 39

Which of the following statements about a test charter are CORRECT?

- 1) It is used mainly in exploratory tests.
- 2) It is used to monitor a test process.
- 3) It may make reference to user stories.
- 4) It contains notes taken during a test session.
- 5) It is used to outline the company test policy.

- A. 2, 3, 4
- B. 2, 4, 5

- C. 1, 3, 4
- D. 1, 2, 5

**Answer: C**

Explanation:

Explanation

A test charter is a document that describes the scope, objective, and approach of an exploratory testing session.

It is used mainly in exploratory tests to guide the tester's actions and record the findings. A test charter may make reference to user stories, requirements, risks, or other sources of information that are relevant to the testing mission. A test charter also contains notes taken during a test session, such as test ideas, test results, bugs, issues, and observations. A test charter is not used to monitor a test process, as it is not a formal metric or report. It is also not used to outline the company test policy, as it is specific to a particular test session and context. References: ISTQB Foundation Level Agile Tester Syllabus, Section 2.2.3, page 18; ASTQB Agile Tester Certification Resources, Section 2.2.3, page 18; How to Write an Exploratory Test Charter, Creating an Exploratory Testing Charter, What is Exploratory Testing?.

#### NEW QUESTION # 40

Which of the following is the BEST way for a test team to keep its independence when working in an Agile development environment?

- A. Assign testers to be members of the Agile team, but ensure the testers report to a different manager than the developers.
- B. Co-locate only some of the testers with the Agile development team, while the rest of the testers are in a different location.
- C. Share the Test Strategy with the Agile development team, but not the details of the Test Cases.
- D. Locate the team that develops the test automation framework in a different location to the Agile development team.

**Answer: A**

#### NEW QUESTION # 41

Which of the following is NOT a typical task performed by the tester within an Agile team?

- A. Ensuring the appropriate testing tasks are scheduled during iteration planning.
- B. Ensuring all project status meetings are held according to the plan.
- C. Working with business stakeholders to clarify requirements.
- D. Suggesting improvements in team retrospectives.

**Answer: B**

Explanation:

Explanation

The tester within an Agile team is not responsible for ensuring all project status meetings are held according to the plan. This is typically a task for the Scrum Master, who facilitates the meetings and ensures that the team follows the Agile principles and practices. The tester within an Agile team is responsible for ensuring the appropriate testing tasks are scheduled during iteration planning, suggesting improvements in team retrospectives, and working with business stakeholders to clarify requirements. These are all tasks that contribute to the quality of the software and the testing process, as well as the collaboration and communication within the team and with the customers. References: ISTQB Foundation Level Agile Tester Syllabus, Section 2.3.1, page 171; ISTQB Foundation Level Agile Tester Sample Exam Questions, Question 2.3.1-1, page 82

#### NEW QUESTION # 42

An Agile project is aimed at developing an e-commerce website that will allow registered users to purchase digital books. During the checkout process, only credit card payments, with supported credit card types, will be accepted.

Consider the following acceptance criterion for a given user story of this Agile project:

"Check that the number of steps required to complete a purchase order during the checkout process is minimized, in order to reduce the risk that the customers will leave the website without completing their orders." Which of the following information would you expect to be the most relevant to create a test aimed at covering this acceptance criterion?

- A. The supported credit card types
- B. The maximum number of digital books that can be purchased in a single order

- C. The maximum number of steps to complete the checkout process
- D. The maximum number of steps to complete the registration process

**Answer: C**

Explanation:

### Comprehensive and Detailed Explanation From Exact Extract:

From CTFL-AT Syllabus v4.0, Section 2.1 Acceptance Criteria and Testability, it states:

Tests should directly address the acceptance criteria defined for a user story. Testers evaluate if the implemented feature meets the criteria, often using quantitative data like number of steps, time taken, or interaction patterns." The acceptance criteria specifically refers to minimizing steps during checkout, so Option Dis most directly aligned with what needs to be tested.

\* Options A, B, and C are unrelated to the acceptance criterion's goal of reducing abandonment due to complex checkout.
