Reliable AWS-DevOps Test Online - Free AWS-DevOps Dumps

People who get AWS-DevOps certification show dedication and willingness to work hard, also can get more opportunities in job hunting. It seems that AWS-DevOps certification becomes one important certification for many IT candidates. While a good study material will do great help in AWS-DevOps Exam Preparation. ITExamSimulator AWS-DevOps will solve your problem and bring light for you. AWS-DevOps exam questions and answers are the best valid with high hit rate, which is the best learning guide for your Amazon AWS-DevOps preparation.

Amazon AWS Certified DevOps Engineer - Professional Sample Questions (Q105-Q110):

NEW QUESTION # 105
A company is running three production web server reserved EC2 instances with EBS-backed root volumes.
These instances have a consistent CPU load of 80%. Traffic is being distributed to these instances by an
Elastic Load Balancer. They also have production and development Multi-AZ RDS MySQL databases. What
recommendation would you make to reduce cost in this environment without affecting availability of
mission-critical systems? Choose the correct answer from the options given below

- A. Consider using spot instances instead of reserved EC2 instances

- B. Considerusing on-demand instances instead of reserved EC2 instances
- C. Considerremovingthe Elastic Load Balancer
- D. Considernot using a Multi-AZ RDS deployment for the development database

Answer: D

Explanation:
Explanation
Multi-AZ databases is better for production environments rather than for development environments, so you can reduce costs by not using this for development environments
Amazon RDS Multi-AZ deployments provide enhanced availability and durability for Database (DB) Instances, making them a natural fit for production database workloads. When you provision a Multi-AZ DB Instance, Amazon RDS automatically creates a primary DB Instance and synchronously replicates the data to a standby instance in a different Availability Zone (AZ). Cach AZ runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable.
In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby (or to a read replica in the case of Amazon Aurora), so that you can resume database operations as soon as the failover is complete. Since the endpoint for your DB Instance remains the same after a failover, your application can resume database operation without the need for manual administrative intervention
For more information on Multi-AZ RDS, please refer to the below link:
* https://aws.amazon.com/rds/details/multi-az/

NEW QUESTION # 106
A production account has a requirement that any Amazon EC2 instance that has been logged into manually must be terminated within 24 hours. All applications in the production account are using Auto Scaling groups with Amazon CloudWatch Logs agent configured.
How can this process be automated?

- A. Create a CloudWatch alarm that will trigger on the login event. Configure the alarm to send to an Amazon SQS queue. Use a group of worker instances to process messages from the queue, which then schedules the Amazon CloudWatch Events rule to trigger.
- B. Create a CloudWatch Logs subscription in an AWS Lambda function. Configure the function to add a tag to the EC2 instance that produced the login event and mark the instance to be decommissioned.
  Create a CloudWatch Events rule to trigger a daily Lambda function that terminates all instances with this tag.
- C. Create a CloudWatch alarm that will trigger on the login event. Send the notification to an Amazon SNS topic that the Operations team is subscribed to, and have them terminate the EC2 instance within 24 hours.
- D. Create a CloudWatch Logs subscription to an AWS Step Functions application. Configure the function to add a tag to the EC2 instance that produced the login event and mark the instance to be decommissioned. Then create a CloudWatch Events rule to trigger a second AWS Lambda function once a day that will terminate all instances with this tag.

Answer: B

Explanation:

NEW QUESTION # 107
A company wants to use a grid system for a proprietary enterprise in-memory data store on top of AWS. This system can run in multiple server nodes in any Linux-based distribution. The system must be able to reconfigure the entire cluster every time a node is added or removed. When adding or removing nodes, an / etc./cluster/nodes.config file must be updated, listing the IP addresses of the current node members of that cluster The company wants to automate the task of adding new nodes to a cluster. What can a DevOps Engineer do to meet these requirements?

- A. Use AWS OpsWorks Stacks to layer the server nodes of that cluster. Create a Chef recipe that populates the content of the /etc/cluster/nodes.config file and restarts the service by using the current members of the layer. Assign that recipe to the Configure lifecycle event.
- B. Put the file nodes.config in version control. Create an AWS CodeDeploy deployment configuration and deployment group based on an Amazon EC2 tag value for the cluster nodes. When adding a new node to the cluster, update the file with all tagged instances, and make a commit in version control. Deploy the new file and restart the services.
- C. Create an Amazon S3 bucket and upload a version of the etc/cluster/nodes.config file. Create a crontab script that will poll

for that S3 file and download it frequently. Use a process manager, such as Monit or systemd, to restart the cluster services when it detects that the new file was modified. When adding a node to the cluster, edit the file's most recent members. Upload the new file to the S3 bucket.
- D. Create a user data script that lists all members of the current security group of the cluster and automatically updates the /etc/cluster/nodes.config file whenever a new instance is added to the cluster

Answer: A

Explanation:
https://docs.aws.amazon.com/opsworks/latest/userguide/workingcookbook-events.html

NEW QUESTION # 108
A DevOps engineer is tasked with migrating Docker containers used for a workload to AWS. The solution must allow for changes to be deployed into development and test environments automatically by updating each container and checking it into a container registry. Once the containers are pushed, they must be deployed automatically.
Which solution will meet these requirements?

- A. Store container images in Amazon ECR. Use AWS CodePipeline to trigger a deployment if a new container version is created. Use AWS CodeDeploy to deploy the image to AWS Fargate.
- B. Store container images in Amazon S3. Run the containers in AWS Elastic Beanstalk using a multicontainer Docker environment. Configure Elastic Beanstalk to redeploy the containers if it detects a new version in Amazon S3.
- C. Store container images in AWS Artifact. Use AWS CodePipeline to trigger a deployment if a new container version is created. Use AWS CodeDeploy to deploy new containers to Amazon EKS.
- D. Store container images in Docker Hub. Install Docker on an Amazon EC2 instance and use AWS CodePipeline and AWS CodeDeploy to deploy any new containers.

Answer: A

NEW QUESTION # 109
Management has reported an increase in the monthly bill from Amazon web services, and they are extremely concerned with this increased cost.
Management has asked you to determine the exact cause of this increase.
After reviewing the billing report, you notice an increase in the data transfer cost.
How can you provide management with a better insight into data transfer use?

- A. Use Amazon CloudWatch Logs to run a map-reduce on your logs to determine high usage and data transfer.
- B. Deliver custom metrics to Amazon CloudWatch per application that breaks down application data transfer into multiple, more specific data points.
- C. Using Amazon CloudWatch metrics, pull your Elastic Load Balancing outbound data transfer metrics monthly, and include them with your billing report to show which application is causing higher bandwidth usage.
- D. Update your Amazon CloudWatch metrics to use five-second granularity, which will give better detailed metrics that can be combined with your billing data to pinpoint anomalies.

Answer: B

NEW QUESTION # 110
......

With the high class operation system, we can assure you that you can start to prepare for the AWS-DevOps exam with our study materials only 5 to 10 minutes after payment since our advanced operation system will send the AWS-DevOps exam torrent to your email address automatically as soon as possible after payment. Most important of all, as long as we have compiled a new version of the AWS-DevOps Guide Torrent, we will send the latest version of our AWS-DevOps training materials to our customers for free during the whole year after purchasing. We will continue to bring you integrated AWS-DevOps guide torrent to the demanding of the ever-renewing exam, which will be of great significance for you to keep pace with the times.
