

Free PDF Quiz PCEP-30-02 - Efficient PCEP - Certified Entry-Level Python Programmer Reliable Exam Answers

2025 Latest TrainingDumps PCEP-30-02 PDF Dumps and PCEP-30-02 Exam Engine Free Share: <https://drive.google.com/open?id=1yUNsgipgVmnDhGZm0HnPAmZX55rmw1IZ>

Our product is revised and updated according to the change of the syllabus and the latest development situation in the theory and the practice. The PCEP-30-02 exam torrent is compiled elaborately by the experienced professionals and of high quality. The contents of PCEP-30-02 guide questions are easy to master and simplify the important information. It conveys more important information with less answers and questions, thus the learning is easy and efficient. The language is easy to be understood makes any learners have no obstacles. The PCEP-30-02 Test Torrent is suitable for anybody no matter he or she is in-service staff or the student, the novice or the experience people who have worked for years. The software boosts varied self-learning and self-assessment functions to check the results of the learning.

If you hope to get a job with opportunity of promotion, it will be the best choice chance for you to choose the PCEP-30-02 study question from our company. Because our PCEP-30-02 study materials have the enough ability to help you improve yourself and make you more excellent than other people. The PCEP-30-02 Learning Materials from our company have helped a lot of people get the certification and achieve their dreams. And you also have the opportunity to contact with the PCEP-30-02 test guide from our company.

Valid PCEP-30-02 Dumps - Exam PCEP-30-02 Objectives Pdf

The field of information technology has seen multiple advancements lately. Reputed companies around the globe have set the PCEP - Certified Entry-Level Python Programmer PCEP-30-02 certification as criteria for multiple well-paid job roles. Only PCEP-30-02 certified will easily get high-paying posts in popular companies. Additionally, a Python Institute PCEP-30-02 Certification holder can climb the career ladder and get promotions within the current organization.

Python Institute PCEP - Certified Entry-Level Python Programmer Sample Questions (Q17-Q22):

NEW QUESTION # 17

Assuming that the following assignment has been successfully executed:

My_list = [1, 1, 2, 3]

Select the expressions which will not raise any exception.

(Select two expressions.)

- A. my_list[6]
- B. my_list[my_list[3]]
- C. my_list[0:1]
- D. my_list[-10]

Answer: B,C

Explanation:

Explanation

The code snippet that you have sent is assigning a list of four numbers to a variable called "my_list". The code is as follows:

```
my_list = [1, 1, 2, 3]
```

The code creates a list object that contains the elements 1, 1, 2, and 3, and assigns it to the variable "my_list".

The list can be accessed by using the variable name or by using the index of the elements. The index starts from 0 for the first element and goes up to the length of the list minus one for the last element. The index can also be negative, in which case it counts from the end of the list. For example, my_list[0] returns 1, and my_list[-1] returns 3.

The code also allows some operations on the list, such as slicing, concatenation, repetition, and membership.

Slicing is used to get a sublist of the original list by specifying the start and end index. For example, my_list[1:3] returns [1, 2].

Concatenation is used to join two lists together by using the + operator. For example, my_list + [4, 5] returns [1, 1, 2, 3, 4, 5].

Repetition is used to create a new list by repeating the original list a number of times by using the * operator. For example, my_list * 2 returns [1, 1, 2, 3, 1, 1, 2, 3].

Membership is used to check if an element is present in the list by using the in operator. For example, 2 in my_list returns True, and 4 in my_list returns False.

The expressions that you have given are trying to access or manipulate the list in different ways. Some of them are valid, and some of them are invalid and will raise an exception. An exception is an error that occurs when the code cannot be executed properly. The expressions are as follows:

A). my_list[-10]: This expression is trying to access the element at the index -10 of the list. However, the list only has four elements, so the index -10 is out of range. This will raise an IndexError exception and output nothing.

B). my_list|my_list | 3| I: This expression is trying to perform a bitwise OR operation on the list and some other operands. The bitwise OR operation is used to compare the binary representation of two numbers and return a new number that has a 1 in each bit position where either number has a 1. For example, 3 | 1 returns 3, because 3 in binary is 11 and 1 in binary is 01, and 11 | 01 is 11. However, the bitwise OR operation cannot be applied to a list, because a list is not a number. This will raise a TypeError exception and output nothing.

C). my_list[6]: This expression is trying to access the element at the index 6 of the list. However, the list only has four elements, so the index 6 is out of range. This will raise an IndexError exception and output nothing.

D). my_list- [0:1]: This expression is trying to perform a subtraction operation on the list and a sublist. The subtraction operation is used to subtract one number from another and return the difference. For example, 3 - 1 returns 2. However, the subtraction operation cannot be applied to a list, because a list is not a number. This will raise a TypeError exception and output nothing.

Only two expressions will not raise any exception. They are:

B). my_list|my_list | 3| I: This expression is not a valid Python code, but it is not an expression that tries to access or manipulate the list. It is just a string of characters that has no meaning. Therefore, it will not raise any exception, but it will also not output anything.

D). my_list- [0:1]: This expression is a valid Python code that uses the slicing operation to get a sublist of the list. The slicing operation does not raise any exception, even if the start or end index is out of range. It will just return an empty list or the closest possible sublist. For example, my_list[0:10] returns [1, 1, 2, 3], and my_list[10:20] returns []. The expression my_list- [0:1] returns the sublist of the list from the index 0 to the index 1, excluding the end index. Therefore, it returns [1]. This expression will not raise any exception, and it will output [1].

Therefore, the correct answers are B. my_list|my_list | 3| I and D. my_list- [0:1].

NEW QUESTION # 18

What is the expected result of the following code?

```
rates = (1.2, 1.4, 1.0)
new = rates[3:]
for rate in rates[-2:]:
    new += (rate,)
print(len(new))
```

- A. 0
- B. 1
- C. The code will cause an unhandled
- D. 2

Answer: C

Explanation:

Explanation

The code snippet that you have sent is trying to use a list comprehension to create a new list from an existing list. The code is as follows:

```
my_list = [1, 2, 3, 4, 5] new_list = [x for x in my_list if x > 5]
```

The code starts with creating a list called "my_list" that contains the numbers 1, 2, 3, 4, and 5. Then, it tries to create a new list called "new_list" by using a list comprehension. A list comprehension is a concise way of creating a new list from an existing list by applying some expression or condition to each element. The syntax of a list comprehension is:

```
new_list = [expression for element in old_list if condition]
```

The expression is the value that will be added to the new list, which can be the same as the element or a modified version of it. The element is the variable that takes each value from the old list. The condition is an optional filter that determines which elements will be included in the new list. For example, the following list comprehension creates a new list that contains the squares of the even numbers from the old list:

```
old_list = [1, 2, 3, 4, 5, 6] new_list = [x ** 2 for x in old_list if x % 2 == 0] new_list = [4, 16, 36]
```

The code that you have sent is trying to create a new list that contains the elements from the old list that are greater than 5. However, there is a problem with this code. The problem is that none of the elements in the old list are greater than 5, so the condition is always false. This means that the new list will be empty, and the expression will never be evaluated. However, the expression is not valid, because it uses the variable x without defining it. This will cause a NameError exception, which is an error that occurs when a variable name is not found in the current scope. The code does not handle the exception, and therefore it will terminate with an error message.

The expected result of the code is an unhandled exception, because the code tries to use an undefined variable in an expression that is never executed. Therefore, the correct answer is D. The code will cause an unhandled exception.

NEW QUESTION # 19

What is the expected output of the following code?

```
collection = []
collection.append(1)
collection.insert(0, 2)
duplicate = collection
duplicate.append(3)
print(len(collection) + len(duplicate))
```

- A. 0
- B. The code raises an exception and outputs nothing.
- C. 1
- D. 2

Answer: B

Explanation:

The code snippet that you have sent is trying to print the combined length of two lists, "collection" and "duplicate". The code is as follows:

```
collection = [] collection.append(1) collection.insert(0, 2) duplicate = collection duplicate.append(3) print(len(collection) +
```

```
len(duplicate))
```

The code starts with creating an empty list called "collection" and appending the number 1 to it. The list now contains [1]. Then, the code inserts the number 2 at the beginning of the list. The list now contains [2, 1].

Then, the code creates a new list called "duplicate" and assigns it the value of "collection". However, this does not create a copy of the list, but rather a reference to the same list object. Therefore, any changes made to

"duplicate" will also affect "collection", and vice versa. Then, the code appends the number 3 to "duplicate".

The list now contains [2, 1, 3], and so does "collection". Finally, the code tries to print the sum of the lengths of "collection" and "duplicate". However, this causes an exception, because the len function expects a single argument, not two. The code does not handle the exception, and therefore outputs nothing.

The expected output of the code is nothing, because the code raises an exception and terminates. Therefore, the correct answer is D. The code raises an exception and outputs nothing.

NEW QUESTION # 20

Drag and drop the conditional expressions to obtain a code which outputs * to the screen.

(Note: some code boxes will not be used.)

pool > 0

pool < 0

pool = 0

pool > 0

```

pool = 42 - 1 // 2
if [ ]:
    print("***")
elif [ ]:
    print("****")
else:
    print("****")

```

Answer:

Explanation:

pool == 0

pool < 0

pool = 0

pool > 0

```

pool = 42 - 1 // 2
if pool > 0:
    print("***")
elif pool < 0:
    print("****")
else:
    print("****")

```

Explanation:

One possible way to drag and drop the conditional expressions to obtain a code which outputs * to the screen is:

```
if pool > 0:
    print("*")
elif pool < 0:
    print("***")
else:
    print("****")
```

This code uses the if, elif, and else keywords to create a conditional statement that checks the value of the variable pool. Depending on whether the value is greater than, less than, or equal to zero, the code will print a different pattern of asterisks to the screen. The print function is used to display the output. The code is indented to show the blocks of code that belong to each condition. The code will output * if the value of pool is positive, ** if the value of pool is negative, and *** if the value of pool is zero.

You can find more information about the conditional statements and the print function in Python in the following references:

- * [Python If... Else]
- * [Python Print Function]
- * [Python Basic Syntax]

NEW QUESTION # 21

What happens when the user runs the following code?

- A. The program outputs five asterisks (*****) to the screen.
- **B. The program outputs one asterisk (*) to the screen.**
- C. The program enters an infinite loop.
- D. The program outputs three asterisks(***) to the screen.

Answer: B

NEW QUESTION # 22
