Free Sample GH-200 Questions, GH-200 Discount Code

SAVE TIME & QUICKLY PREPARE WITH REAL QUESTIONS

Our GH-200 exam questions are authoritatively certified. Our goal is to help you successfully pass relevant GH-200 exam in an efficient learning style. Due to the quality and reasonable prices of our GH-200 training materials, our competitiveness has always been a leader in the world. Our GH-200 Learning Materials have a higher pass rate than other training materials, so we are confident to allow you to gain full results. With our GH-200 exam questions, your success is guaranteed.

Microsoft GH-200 Exam Syllabus Topics:

Topic	Details
Topic 1	 Author and Maintain Workflows: This section of the exam measures skills of DevOps Engineers and Automation Specialists and covers building and managing workflows triggered by events such as pushes, scheduled times, manual triggers, and webhooks. It includes understanding workflow components like jobs, steps, actions, and runners, syntax correctness, environment variables, secrets management, and dependencies between jobs. Candidates will also demonstrate practical abilities to create workflows for various purposes, including publishing packages, using service containers, routing jobs, and deploying releases to cloud providers.
Topic 2	 Manage GitHub Actions in the Enterprise: This section measures the expertise of Enterprise Administrators and Platform Engineers in distributing and managing GitHub Actions and workflows at the organizational level. It includes reuse and sharing of templates, strategies for managing reusable components via repositories and naming conventions, controlling access to actions, setting organization-wide usage policies, and planning maintenance to ensure efficient enterprise-wide deployment of GitHub Actions.
Topic 3	Author and Maintain Actions: This domain evaluates the abilities of Action Developers and Automation Engineers to select and create suitable types of GitHub Actions, such as JavaScript, Docker containers, or run steps. It emphasizes troubleshooting action code, understanding the components and file structures of actions, and using workflow commands within actions to communicate with runners, including exit code management.
Topic 4	Consume Workflows: This domain targets Software Developers and Quality Assurance Engineers and focuses on interpreting workflow runs and their outcomes. It covers identifying triggering events, reading workflow configurations, troubleshooting failures by analyzing logs, enabling debug logging, managing environment variables, caching dependencies, and passing data between jobs. Candidates also manage workflow runs, artifacts, approvals, and status badges, as well as locating workflows within repositories and leveraging organizational templated workflows.

Microsoft GH-200 Exam Dumps - Get Success In First Attempt [2025]

The GitHub Actions (GH-200) exam questions can help you gain the high-in-demand skills and credentials you need to pursue a rewarding career. To do this you just need to pass the GitHub Actions (GH-200) certification exam which is not easy to crack. You have to put in some extra effort, and time and prepare thoroughly to pass the GitHub Actions (GH-200) exam. For the quick, complete, and comprehensive GitHub Actions (GH-200) exam dumps preparation you can get help from top-notch and easy-to-use GH-200 Questions.

Microsoft GitHub Actions Sample Questions (Q13-Q18):

NEW QUESTION #13

Which of the following scenarios requires a developer to explicitly use the GITHUB TOKEN or github token secret within a

workflow? (Choose two.)

- A. passing the GITHUB TOKEN secret to an action that requires a token as an input
- B. checking out source code with the actions/checkout@v3 action
- C. making an authenticated GitHub API request
- D. assigning non-default permissions to the GITHUB TOKEN

Answer: A,C

Explanation:

Some actions may require a GITHUB_TOKEN as an input to authenticate and perform specific tasks, such as creating issues, commenting on pull requests, or interacting with the GitHub API. In such cases, you would need to explicitly pass the token to the action

When making an authenticated GitHub API request, the GITHUB_TOKEN is required to authenticate the request. This token is automatically provided by GitHub in the workflow, and it must be explicitly used when interacting with the GitHub API.

NEW QUESTION #14

As a developer, how can you identify a Docker container action on GitHub?

- A. The action.yml metadata file has the runs.using value set to Docker.
- B. The action's repository name includes the keyword "Docker."
- C. The action's repository includes @actions/core in the root directory.
- D. The action.yml metadata file references a Dockerfile file.

Answer: A

Explanation:

In a Docker container action, the action.yml file includes the runs.using field, which is set to docker to specify that the action runs inside a Docker container. This is the key indicator that the action is a Docker container action.

NEW QUESTION #15

As a developer, you are designing a workflow and need to communicate with the runner machine to set environment variables, output values used by other actions, add debug messages to the output logs, and other tasks. Which of the following options should you use?

- A. workflow commands
- B. enable debug logging
- C. environment variables
- D. composite run step
- E. self-hosted runners

Answer: A

Explanation:

Workflow commands for GitHub Actions

You can use workflow commands when running shell commands in a workflow or in an action's code.

About workflow commands

Actions can communicate with the runner machine to set environment variables, output values used by other actions, add debug messages to the output logs, and other tasks.

Most workflow commands use the echo command in a specific format, while others are invoked by writing to a file.

NEW QUESTION #16

Without the need to use additional infrastructure, what is the simplest and most maintainable method for configuring a workflow job to provide access to an empty PostgreSQL database?

• A. Run the actions/postgres action in a parallel job.

- B. Use service containers with a Postgres database from Docker hub.
- C. Dynamically provision and deprovision an environment.
- D. It is currently impossible to access the database with GitHub Actions.

Answer: B

Explanation:

GitHub Actions supports the use of service containers, which allows you to spin up a PostgreSQL database (or any other service) in a Docker container during your workflow. You can pull a PostgreSQL image from Docker Hub, and the container will automatically be available to your workflow job. This method requires no additional infrastructure and is easy to configure and maintain, as you simply define the container in the workflow file.

NEW QUESTION #17

As a developer, how can you identify a composite action on GitHub?

- A. The action's repository name includes the keyword "composite."
- B. The action yml metadata file has the runs using value set to composite.
- C. The action's repository includes an init.sh file in the root directory.
- D. The action's repository includes Dockerfile and package json files.

Answer: B

Explanation:

runs.using for composite actions

Required: You must set this value to 'composite'.
