DOWNLOAD the newest BraindumpsPrep SK0-005 PDF dumps from Cloud Storage for free: <https://drive.google.com/open?id=1Z0LxKPl03uOSjDm1vvV62246ccK0GIU>

Without a doubt, there is one thing that can assist them with perceiving this interest and clearing their CompTIA Server+ Certification Exam (SK0-005) exam with flying colors. CompTIA SK0-005 dumps merge all that gigantic and the competitor doesn't require to purchase the aide or different books to review. They have this test material and need nothing else for planning CompTIA Server+ Certification Exam exam.

Once you have practiced and experienced the quality of our SK0-005 exam preparation, you will remember the serviceability and usefulness of them. For the excellent quality of our SK0-005 training questions explains why our SK0-005 practice materials helped over 98 percent of exam candidates get the certificate you dream of successfully. Believe me with our SK0-005 Guide quiz, you will be more confident to pass the exam in the shortest time with ease.

100% Pass Quiz 2025 High-quality CompTIA SK0-005: Free CompTIA Server+ Certification Exam Updates

Attending training institution or having CompTIA online training classes may be a good choice for candidates. But for people who have no time and energy to prepare for SK0-005 practice exam, training calss will make them tired and exhausted. The most effective way for them to pass SK0-005 Actual Test is choosing best study materials that you will find in BraindumpsPrep.

CompTIA Server+ Certification Exam is ideal for IT professionals who are responsible for managing and maintaining server infrastructure, such as network administrators, system administrators, and technicians. It covers topics such as server architecture, virtualization, storage, security, disaster recovery, and troubleshooting. SK0-005 Exam is vendor-neutral, which means that it does not focus on any specific technology or vendor, making it a valuable certification for IT professionals working in diverse environments.

CompTIA Server+ Certification Exam Sample Questions (Q57-Q62):

NEW QUESTION # 57

Users report that the FinanceApp software is not running, and they need immediate access. Issues with the FinanceApp software occur every week after the IT team completes server system updates. The users, however, do not want to contact the help desk every time the issue occurs. The users also report the new MarketApp software is not usable when it crashes, which can cause significant downtime. The technician who restarted the MarketApp software noticed it is running under a test account, which is a likely cause of the crashes.

INSTRUCTIONS

Using the Services menu provided, modify the appropriate application services to remedy the stated issues.

Answer:

Explanation:

See the solution in explanation.

Explanation

FinanceApp software is running as a service named "FinanceApp Service". The service description says "Provides financial data and calculations for the FinanceApp software". The service status is "Stopped", which means that the service is not running and the software is not functional. The service startup type is "Manual", which means that the service needs to be started manually by the user or the administrator. The service log on as is "Local System", which means that the service runs under a predefined local account that has extensive privileges on the local computer.

To fix the issue with the FinanceApp software, you need to do two things:

First, you need to start the service, so that the software can run. To do this, you can right-click on the service name and select "Start" from the menu. Alternatively, you can select the service name and click on the "Start" button on the toolbar. You should see a message saying that the service has started successfully.

Second, you need to change the service startup type, so that the service can start automatically every time the server boots up. This way, you don't have to contact the help desk every time the issue occurs.

To do this, you can right-click on the service name and select "Properties" from the menu. Alternatively, you can select the service name and click on the "Properties" button on the toolbar. You should see a window with several tabs and options. On the "General" tab, under "Startup type", you can select

"Automatic" from the drop-down list. Then, click on "OK" to save your changes.

By doing these two steps, you should be able to use the FinanceApp software without any problems.

The MarketApp software is running as a service named "MarketApp Service". The service description says

"Provides market data and analysis for the MarketApp software". The service status is "Running", which means that the service is running and the software is functional. However, as you reported, the software may crash sometimes, which can cause significant downtime. The service startup type is "Automatic", which means that the service starts automatically every time the server boots up.

The service log on as is

"TestAccount", which is a test account that was probably used for development or testing purposes.

To fix the issue with the MarketApp software, you need to do one thing:

You need to change the service log on as, so that the service runs under a proper account that has sufficient permissions and security settings for production use. To do this, you can right-click on the service name and select "Properties" from the menu. Alternatively, you can select the service name and click on the "Properties" button on the toolbar. You should see a window with several tabs and options.

On the "Log On" tab, under "Log on as", you can select either "Local System account" or "This account". If you choose "Local System account", then the service will run under a predefined local account that has extensive privileges on the local computer. If you

choose "This account", then you will need to enter a valid username and password for an account that has appropriate permissions and security settings for running the service. You may need to consult with your IT team or your software vendor to determine which option is best for your situation. Then, click on "OK" to save your changes.

NEW QUESTION # 58

A company needs to increase the security controls on its servers. An administrator is implementing MFA on all servers using cost effective techniques. Which of the following should the administrator use to satisfy the MFA requirement?

- A. Smart carts
- **B. Push notifications**
- C. Biometrics
- D. Physical tokens

Answer: B

Explanation:

Explanation

Push notifications are messages that are sent from an application or a service to a user's device without requiring the user to open or request them. They can be used as a cost-effective technique for implementing MFA (Multi-Factor Authentication) on servers by sending verification codes or approval requests to the user's smartphone or tablet when they try to log in to the server. Verified

References: [Push notifications], [MFA]

NEW QUESTION # 59

Which of the following server types would benefit MOST from the use of a load balancer?

- A. DHCP server
- B. DNS server
- C. File server
- **D. Web server**

Answer: D

Explanation:

The server type that would benefit most from the use of a load balancer is web server. A web server is a server that hosts web applications or websites and responds to requests from web browsers or clients. A load balancer is a device or software that distributes network traffic across multiple servers based on various criteria, such as availability, capacity, or performance. A load balancer can improve the scalability, reliability, and performance of web servers by balancing the workload and preventing any single server from being overloaded or unavailable.

NEW QUESTION # 60

Which of the following is an example of load balancing?

- A. Active-passive
- **B. Round robin**
- C. Active-active
- D. Failover

Answer: B

Explanation:

Explanation

Round robin is an example of load balancing. Load balancing is the method of distributing network traffic equally across a pool of resources that support an application. Load balancing improves application availability, scalability, security, and performance by preventing any single resource from being overloaded or unavailable. Round robin is a simple load balancing algorithm that assigns each incoming request to the next available resource in a circular order. For example, if there are three servers (A, B, C) in a load balancer pool, round robin will send the first request to server A, the second request to server B, the third request to server C, the fourth request to server A again, and so on.

NEW QUESTION # 61

A systems administrator recently installed a new virtual server. After completing the installation, the administrator was only able to reach a few of the servers on the network. While testing, the administrator discovered only servers that had similar IP addresses were reachable. Which of the following is the most likely cause of the issue?

- A. There is an improper DNS configuration.
- B. The subnet mask is incorrect.
- C. The jumbo frames are not enabled.
- D. There is an IP address conflict.

Answer: B

Explanation:

A subnet mask is a number that distinguishes the network address and the host address within an IP address¹. A subnet mask allows network traffic to understand IP addresses by splitting them into the network and host addresses. If the subnet mask is incorrect, the network traffic may not be able to determine the correct destination for the packets, and only reach some of the servers that have similar IP addresses. For example, if the new virtual server has an IP address of 192.168.1.100 and a subnet mask of 255.255.0.0, it can only communicate with servers that have IP addresses in the range of 192.168.0.0 to 192.168.255.255. To fix this issue, the systems administrator needs to check and correct the subnet mask of the new virtual server according to the network configuration.

NEW QUESTION # 62
