You only need 20-30 hours to learn SAA-C03 exam torrent and prepare the SAA-C03 exam. Many people, especially the in-service staff, are busy in their jobs, learning, family lives and other important things and have little time and energy to learn and prepare the SAA-C03 exam. But if you buy our SAA-C03 Test Torrent, you can invest your main energy on your most important thing and spare 1-2 hours each day to learn and prepare the exam. Our SAA-C03 exam questions and answers are based on the real exam and conform to the popular trend in the candidates.

Why is the Amazon SAA-C03 test dump chosen by so many IT candidates? Firstly, the high quality and latest material are the important factors of SAA-C03 vce exam. Besides, time and money can be saved by use of the SAA-C03 brain dumps. Instant download is available for you, thus you can study as soon as you complete purchase. Moreover, one year free update is the privilege after your purchase. You will get the latest study material for preparation. Hurry up to choose SAA-C03 Training Pdf, you will success without doubt.

SAA-C03 Exam Torrent & SAA-C03 Exam Preparation & SAA-C03 Test Dumps

If you choose our SAA-C03 exam question for related learning and training, the system will automatically record your actions and analyze your learning effects. simulation tests of our SAA-C03 learning materials have the functions of timing and mocking exams, which will allow you to adapt to the exam environment in advance and it will be of great benefit for subsequent exams. After you complete the learning task, the system of our SAA-C03 Test Prep will generate statistical reports based on your performance so that you can identify your weaknesses and conduct targeted training and develop your own learning plan. For the complex part of our SAA-C03 exam question, you may be too cumbersome, but our system has explained and analyzed this according to the actual situation to eliminate your doubts and make you learn better.

Amazon AWS Certified Solutions Architect - Associate Sample Questions (Q229-Q234):

NEW QUESTION # 229

[Design Secure Architectures]

A solutions architect creates a VPC that includes two public subnets and two private subnets. A corporate security mandate requires the solutions architect to launch all Amazon EC2 instances in a private subnet. However, when the solutions architect launches an EC2 instance that runs a web server on ports 80 and 443 in a private subnet, no external internet traffic can connect to the server. What should the solutions architect do to resolve this issue?

- **A. Provision an internet-facing Application Load Balancer (ALB) in a public subnet. Add the EC2 instance to the target group that is associated with the ALB. Ensure that the DNS record for the website resolves to the ALB.**
- B. Ensure that the security group that is attached to the EC2 instance allows HTTP traffic on port 80 and HTTPS traffic on port 443. Ensure that the DNS record for the website resolves to the public IP address of the EC2 instance.
- C. Launch a NAT gateway in a private subnet. Update the route table for the private subnets to add a default route to the NAT gateway. Attach a public Elastic IP address to the NAT gateway.
- D. Attach the EC2 instance to an Auto Scaling group in a private subnet. Ensure that the DNS record for the website resolves to the Auto Scaling group identifier.

Answer: A

Explanation:

An Application Load Balancer (ALB) is a type of Elastic Load Balancer (ELB) that distributes incoming application traffic across multiple targets, such as EC2 instances, containers, Lambda functions, and IP addresses, in multiple Availability Zones¹. An ALB can be internet-facing or internal. An internet-facing ALB has a public DNS name that clients can use to send requests over the internet¹. An internal ALB has a private DNS name that clients can use to send requests within a VPC¹. This solution meets the requirements of the question because:

It allows external internet traffic to connect to the web server on ports 80 and 443, as the ALB listens for requests on these ports and forwards them to the EC2 instance in the private subnet¹.

It does not violate the corporate security mandate, as the EC2 instance is launched in a private subnet and does not have a public IP address or a route to an internet gateway².

It reduces the operational overhead, as the ALB is a fully managed service that handles the tasks of load balancing, health checking, scaling, and security¹.

NEW QUESTION # 230

[Design High-Performing Architectures]

A company wants to create a payment processing application. The application must run when a payment record arrives in an existing Amazon S3 bucket. The application must process each payment record exactly once. The company wants to use an AWS Lambda function to process the payments.

Which solution will meet these requirements?

- A. Configure the existing S3 bucket to send object creation events to an Amazon Simple Queue Service (Amazon SQS) queue. Configure the Lambda function to run when a new event arrives in the SQS queue.
- B. Configure the existing S3 bucket to send object creation events to Amazon EventBridge. Configure EventBridge to route events to an Amazon Simple Queue Service (Amazon SQS) FIFO queue. Configure the Lambda function to run when a new

event arrives in the SQS queue.

- C. Configure the existing S3 bucket to send object creation events directly to the Lambda function. Configure the Lambda function to handle object creation events and to process the payments.
- **D. Configure the existing S3 bucket to send object creation events to an Amazon Simple Notification Service (Amazon SNS) topic. Configure the Lambda function to run when a new event arrives in the SNS topic.**

Answer: D

NEW QUESTION # 231

A company runs an application on several Amazon EC2 instances. Multiple Amazon Elastic Block Store (Amazon EBS) volumes are attached to each EC2 instance. The company needs to back up the configurations and the data of the EC2 instances every night. The application must be recoverable in a secondary AWS Region.

Which solution will meet these requirements in the MOST operationally efficient way?

- A. Configure an AWS Lambda function to take nightly snapshots of the application's EBS volumes and to copy the snapshots to a secondary Region.
- B. Configure an AWS Lambda function to take nightly snapshots of the application's EBS volumes and to copy the snapshots to a secondary Availability Zone.
- C. Create a backup plan in AWS Backup to take nightly backups. Copy the backups to a secondary Region. Add the EBS volumes to a resource assignment as part of the backup plan.
- **D. Create a backup plan in AWS Backup to take nightly backups. Copy the backups to a secondary Region. Add the EC2 instances to a resource assignment as part of the backup plan.**

Answer: D

Explanation:

AWS Backup is a fully managed backup service that can create backup plans for EC2 instances, including both instance configurations and attached EBS volumes, with scheduled and cross-Region copy capabilities.

By adding the EC2 instances to the resource assignment in the backup plan, AWS Backup automatically backs up all configurations and attached EBS volumes, and can copy backups to a secondary Region for disaster recovery, providing the highest operational efficiency with the least manual effort.

AWS Documentation Extract:

"AWS Backup provides fully managed backup for EC2 instances and attached EBS volumes, with scheduling, retention, and cross-Region copy built in. By adding the EC2 instance as a resource, the backup includes both configuration and attached volumes." (Source: AWS Backup documentation) A, D: Custom Lambda scripts increase operational overhead and are not as integrated or robust as AWS Backup.

C: Assigning only EBS volumes does not include the EC2 instance configuration, which is needed for full recovery.

NEW QUESTION # 232

[Design Resilient Architectures]

A company is concerned about the security of its public web application due to recent web attacks. The application uses an Application Load Balancer (ALB). A solutions architect must reduce the risk of DDoS attacks against the application.

What should the solutions architect do to meet this requirement?

- A. Add an Amazon Inspector agent to the ALB.
- B. Configure Amazon GuardDuty to monitor the ALB.
- **C. Enable AWS Shield Advanced to prevent attacks.**
- D. Configure Amazon Macie to prevent attacks.

Answer: C

Explanation:

AWS Shield Advanced provides expanded DDoS attack protection for your Amazon EC2 instances, Elastic Load Balancing load balancers, CloudFront distributions, Route 53 hosted zones, and AWS Global Accelerator standard accelerators. <https://docs.aws.amazon.com/waf/latest/developerguide/what-is-aws-waf.html>

NEW QUESTION # 233

Which solution will meet these requirements MOST cost-effectively?

- **A. Configure General Purpose SSD (gp3) EBS volumes. Provision 15,000 IOPS.**
- B. Configure General Purpose SSD (gp2) EBS volumes. Provision a 5 TiB volume.
- C. Configure magnetic EBS volumes to achieve maximum IOPS.
- D. Configure Provisioned IOPS SSD (io1) EBS volumes. Provision 15,000 IOPS.

Answer: A

Explanation:

EBS gp3 volumes allow you to independently configure IOPS and throughput, up to 16,000 IOPS, regardless of the volume size, and at a lower cost compared to io1/io2 provisioned IOPS volumes. This meets the requirement for cost-effective, predictable IOPS performance for Amazon RDS for PostgreSQL.

AWS Documentation Extract:

"With gp3 volumes, you can provision performance independent of storage capacity, up to 16,000 IOPS. This allows for cost-effective scaling for applications that require high performance at a lower price point compared to io1." (Source: Amazon EBS documentation, gp3 Volumes)

* A: gp2 ties IOPS to volume size; 5 TiB is wasteful if only 15,000 IOPS are needed.

* B: io1 works but is significantly more expensive than gp3 for most workloads.

* D: Magnetic volumes do not support high IOPS.
