100% Pass Professional ServiceNow - Pdf Demo CAD Download

One of features of CAD training materials of us is that we can help you pass the exam just one time, and we also pass guarantee and money back guarantee for you fail to pass the exam. You just need to send your failure scanned to us, and we will give you full refund. In addition, CAD exam dumps contain both questions and answers, which can help you have a quickly check after you finish your practice. We also have online and offline chat service stuff, they possess the professional knowledge about the CAD Training Materials, if you have any questions just contact us.

ServiceNow CAD Certification Exam is not an easy certification to attain as it requires a deep understanding of ServiceNow's development principles, functionalities, and best practices. However, it is worth the effort to earn the certification as it is a valuable credential in the ServiceNow ecosystem. The CAD certification can open doors for the candidate to work with different organizations and lead to promotions and salary raises. Additionally, ServiceNow has a robust certification program that offers a clear path for individuals looking to excel in ServiceNow development, with the CAD Certification being a cornerstone of that path.

ServiceNow Certified Application Developer-ServiceNow Sample Questions (Q142-Q147):

NEW QUESTION # 142

You are developing the MyApp application that has a table, Table A. When the MyApp application is installed on another instance, you want Table A's records to be installed as part of the application. Table A's records will be installed when:

- A. Table A has an automatic number counter for new records and the table property "Include data" is set to true.
- B. Table A is not included in the System Clone > Exclude Tables list.
- C. Table A's records are added to the application record using the "Create Application Files" feature.
- D. Table A is active and extends the Task table.

Answer: C

Explanation:

To include specific records from a table (often referred to as seed data) when distributing an application in ServiceNow, developers must add these records to the application as application files. This ensures that when the application is installed on another instance, the specified records are included.

Option C is correct because using the "Create Application Files" feature allows developers to select specific records to include in the application package. This process creates application files for the selected records, ensuring they are installed along with the application on other instances.

Options A, B, and D are incorrect:

A: The activation status of Table A and whether it extends the Task table do not determine whether its records are included during installation.

B: Having an automatic number counter and setting a table property do not control the inclusion of records in the application package.

D: The System Clone > Exclude Tables list pertains to cloning operations and does not affect application installation.

For detailed guidance on including table records in application deployments, refer to the official ServiceNow documentation: [SERVICENOW.COM](https://docs.servicenow.com)

NEW QUESTION # 143

What is the REST API Explorer used to do?

- A. Find resources on the web for learning about REST
- B. Convert SOAP Message functions to REST methods
- **C. Create sample code for sending REST requests to ServiceNow**
- D. Practice using REST to interact with public data providers

Answer: C

Explanation:

One of the uses of the ServiceNow REST API Explorer is to create sample code for sending REST requests to ServiceNow. The REST API Explorer is a tool that allows you to discover and test the ServiceNow REST APIs. You can select an API endpoint, set the HTTP method, parameters, headers, and body, and then execute the request. The REST API Explorer will show you the response status, headers, and body, as well as generate sample code for various languages and frameworks, such as cURL, Java, JavaScript, Node.js, Python, Ruby, and more. Reference: [Use the REST API Explorer - Product Documentation: Tokyo - ServiceNow], [Introduction to Scripted REST APIs - ServiceNow Developers]

NEW QUESTION # 144

Which one of the following is true for a Script Include with a Protection Policy value of Protected?

- A. Any user with the protected_edit role can see and edit the Script Include
- B. The Protection Policy is applied only if the glide.app.apply_protection system property value is true
- C. The Protection policy option can only be enabled by a user with the admin role
- **D. The Protection Policy is applied only if the application is downloaded from the ServiceNow App Store**

Answer: D

Explanation:

https://docs.servicenow.com/bundle/rome-application-development/page/build/applications/concept/c_ScriptProtectionPolicy.html

The following is true for a Script Include with a Protection Policy value of Protected:

The Protection Policy is applied only if the application is downloaded from the ServiceNow App Store. This is true because the Protection Policy is a feature that allows developers to protect their Script Includes from being viewed or modified by other users when they distribute their applications through the ServiceNow App Store. The Protection Policy is only enforced when the application is installed from the App Store, not when it is developed or tested on the instance.

The following are not true for a Script Include with a Protection Policy value of Protected:

Any user with the protected_edit role can see and edit the Script Include. This is false because the protected_edit role is not related to the Protection Policy, but to the Access Control (ACL) rules. The protected_edit role allows users to edit protected fields on a table, such as the script field on the sys_script table, which stores the Business Rules. The Protection Policy does not use roles to control access to the Script Includes, but a cryptographic key that is generated when the application is published to the App Store. The Protection policy option can only be enabled by a user with the admin role. This is false because the Protection policy option

can be enabled by any user who has the application_admin role for the scoped application that contains the Script Include. The application_admin role grants full access to the application development and administration within the scope of the application. The Protection Policy is applied only if the glide.app.apply_protection system property value is true. This is false because the glide.app.apply_protection system property is not related to the Protection Policy, but to the Application Restricted Caller Access (ARCA) feature. The ARCA feature allows developers to restrict the access to the Script Includes from other applications based on the caller's scope. The glide.app.apply_protection system property determines whether the ARCA feature is enabled or disabled on the instance. References: Script Includes, Protect Script Includes, Application Restricted Caller Access

NEW QUESTION # 145

How does the Application Picker interact with Application Scope in ServiceNow?

- A. Selecting Global in the Application Picker sets the Application Scope to Incident.
- B. Selecting an application from the Application Picker does not set the Application Scope.
- **C. Selecting an application from the Application Picker sets the Application Scope.**
- D. Global is a reserved application that does not appear in the Application Picker.

Answer: C

Explanation:

Comprehensive and Detailed Step-by-Step

Understanding Application Scope and Picker:

The Application Picker in ServiceNow allows developers to switch between different applications (scopes).

When you select an application from the Application Picker, the Application Scope is set to that application, enabling you to develop or configure within that scope.

Why Other Options Are Incorrect:

Option A: The Global application does appear in the Application Picker.

Option B: Selecting Global does not set the scope to Incident; it sets the scope to the Global application, which is not restricted by scoped boundaries.

Option D: Selecting an application does indeed set the Application Scope.

Reference:

ServiceNow Developer Documentation on Application Scope.

NEW QUESTION # 146

How many applications menus can an application have?

- **A. As many as the application design requires**
- B. 3, one for an application's user modules, one for an application's administrator modules, and one for the ServiceNow administrator's modules
- C. 2, one for an application's user modules and one for an application's administrator modules
- D. 1, which is used for all application modules

Answer: A

Explanation:

Reference: https://docs.servicenow.com/bundle/orlando-platform-user-interface/page/administer/navigation-and-ui/task/t_CreateAnApplicationMenu.html An application can have as many application menus as the application design requires. An application menu is a container for application modules, which are links to features or functionalities within an application. Application menus are displayed in the application navigator, which is the left sidebar of the ServiceNow interface. Developers can create and configure application menus using Studio or the Application Menus module. Application menus can have different roles and visibility settings, depending on the intended audience and purpose of the application. References: [ServiceNow Docs - Application menus], [ServiceNow Docs - Create an application menu]
