- A. Client/server
- B. LAN
- C. Peer-to-peer
- D. MAC

Answer: B

NEW QUESTION # 94
A user is unable to connect from one workstation to another workstation. Which of the following should be configured to fix this issue?

- A. Firewall
- B. Certificate
- C. Anti-malware
- D. Database

Answer: A

Explanation:
A firewall can block traffic between workstations if it's not properly configured. If a user cannot connect from one device to another on the network, it is likely that the firewall settings are preventing this communication.
"Firewalls control the incoming and outgoing network traffic based on predetermined security rules. If improperly configured, they may block legitimate access between devices." - CompTIA ITF+ Study Guide Other options:
B . Database - Not related to connectivity
C . Anti-malware - Protects from malicious software, not network configuration D . Certificate - Used for secure communication, but not basic connectivity Correct answer: A

- A. Private browsing
- B. Pop-up blocker
- C. Accessibility options

- C. Reset the router.
- D. Decrease the Wi-Fi signal range.

Answer: B

Explanation:

"One of the most effective ways to secure a wireless network is by changing the default and existing passwords to prevent unauthorized access." - CompTIA ITF+ Security Topics Calling support may help but doesn't address the issue directly.
Decreasing signal range may reduce but not eliminate access.
Resetting the router is more disruptive and unnecessary if the password can be changed.
