WGUSecure Software Design (KEO1) Exam Sample Questions (Q103-Q108):

NEW QUESTION # 103
Which concept is demonstrated when every module in a particular abstraction layer of a computing environment can only access the information and resources that are necessary for its legitimate purpose?

- A. Elevation of Privilege
- B. Privacy
- C. Principle of Least Privilege
- D. Confidentiality

Answer: C

NEW QUESTION # 104
Which software control test examines the internal logical structures of a program and steps through the code line by line to analyze the program for potential errors?

- A. Dynamic testing
- B. Reasonableness testing
- C. White box testing
- D. Black box testing

Answer: C

Explanation:
White box testing, also known as clear box testing, glass box testing, transparent box testing, and structural testing, is a method of software testing where the internal structure, design, and coding of the software are tested to verify the flow of input-output and to improve the design, usability, and security. It involves looking at the structures that are internal to the system, with the tester having knowledge of the internal workings of the product. This type of testing is concerned with examining the internal logical structures of the program and is typically performed by stepping through the code line by line to analyze the program for potential errors, which aligns with the description of the control test in question.

NEW QUESTION # 105
The organization is moving from a waterfall to an agile software development methodology, so the software security group must adapt the security development life cycle as well. They have decided to break out security requirements and deliverables to fit better in the iterative life cycle by defining every-sprint requirements, one- time requirements, bucket requirements, and final security review requirements.
Which type of requirement slates that the team must identify primary security and privacy contacts?

- A. Every-sprint requirement
- B. Bucket requirement
- C. One-time requirement
- D. Final security review requirement

Answer: B

Explanation:
Bucket requirements are ongoing requirements that do not need to be addressed every sprint but must be completed before project completion. Identifying primary security and privacy contacts is a bucket requirement because it is a one-time, essential task that supports security governance throughout the project lifecycle. Every-sprint requirements (D) are repeated tasks for each sprint, one-

time requirements (C) are tasks performed once usually early in the project, and final security review (B) occurs at project end. Agile SDL adaptation recommendations by Microsoft SDL and OWASP emphasize categorizing security tasks to fit iterative delivery, with bucket requirements ensuring important but non-iterative activities are not overlooked.

NEW QUESTION # 106

Which DKEAD category has a risk rating based on the threat exploit's potential level of harm?

- A. Affected users
- B. Exploitability
- C. Reproducibility
- D. Damage potential

Answer: D

Explanation:
The DKEAD category that has a risk rating based on the threat exploit's potential level of harm is Damage potential. This category assesses the total damage or impact that a threat could cause if it is exploited by an attacker. The risk rating in this category is determined by evaluating the severity of the potential damage, which could range from information disclosure to complete system destruction or loss of system availability.

NEW QUESTION # 107

Which type of security analysis is performed using automated software tools while an application is running and is most commonly executed during the testing phase of the SDLC?

- A. Dynamic analysis
- B. Manual code review
- C. Fuzz testing
- D. Static analysis

Answer: A

Explanation:
Dynamic analysis is a security testing method that involves analyzing the behavior of software while it is running or in execution. It is most commonly executed during the testing phase of the Software Development Life Cycle (SDLC). This type of analysis is used to detect issues that might not be visible in the code's static state, such as runtime errors and memory leaks. Automated tools are employed to perform dynamic analysis, which can simulate attacks on the application and identify vulnerabilities that could be exploited by malicious actors.
: The information provided here is verified by multiple sources that discuss security automation in the SDLC and the role of dynamic analysis during the testing phase123.
