CLO-002 Test Labs | CLO-002 Exam Dumps Collection

Technologies are changing at a very rapid pace. Therefore, the CompTIA Cloud Essentials+ Certification Exam in Procurement and Supply CompTIA has become very significant to validate expertise and level up career. Success in the CompTIA Cloud Essentials+ Certification Exam examination helps you meet the ever-changing dynamics of the tech industry. To advance your career, you must register for the CompTIA Cloud Essentials+ Certification Exam CLO-002 in Procurement and Supply CompTIA test and put all your efforts to crack the CompTIA CLO-002 challenging examination.

CompTIA Cloud Essentials+ Certification Exam Sample Questions (Q488-Q493):

NEW QUESTION # 488

Which of the following data management approaches represents geo-redundancy?

- A. The storage is asynchronously replicated across several storage clusters in multiple zones.
- B. The storage is synchronously replicated across several storage clusters in a single region.
- C. The storage is synchronously replicated across several storage clusters in a single zone.
- D. The storage is asynchronously replicated across several storage clusters in multiple regions.

Answer: D

NEW QUESTION # 489

A company's SaaS provider recently changed its licensing model, and a business analyst is required to do an overall cost analysis for a three-year contract renewal. Which of the following will provide the entire financial forecast over the renewal period?

- A. ROI
- B. RFI
- C. TCOSOW

Answer: C

Explanation:

TCO, or Total Cost of Ownership, is a metric that helps to estimate the total cost of acquiring and maintaining a product, service, or investment over its lifetime. TCO includes not only the initial purchase price, but also any ongoing costs, such as maintenance, support, upgrades, licensing, or disposal. TCO is useful for comparing different options and making informed decisions based on the long-term implications of each option. In this case, the company needs to do a cost analysis for a three-year contract renewal with a SaaS provider that changed its licensing model. To do this, the company needs to consider the TCO of the SaaS service, which includes the cost of the license, the cost of any additional features or services, the cost of integration with other systems, the cost of training and support, and the cost of any potential risks or issues. By calculating the TCO, the company can forecast the entire financial impact of the contract renewal over the three-year period and compare it with other alternatives. ROI, or Return on Investment, is a metric that measures the performance or profitability of an investment. ROI compares the amount of money invested in a project or asset with the amount of money gained or saved as a result of that investment. ROI is useful for evaluating the effectiveness and efficiency of an investment and determining if it is worth pursuing. However, ROI does not account for the total cost of ownership of an investment, nor does it consider the time value of money or the opportunity cost of investing in something else. Therefore, ROI is not the best metric to use for forecasting the entire financial impact of a contract renewal over a long period of time. SOW, or Statement of Work, is a document that defines the scope, deliverables, timeline, and terms of a project or contract. SOW is useful for establishing the expectations and responsibilities of both parties involved in a project or contract and ensuring that they are aligned and agreed upon. However, SOW does not provide a financial forecast or analysis of a project or contract, nor does it compare different options or alternatives. Therefore, SOW is not the best metric to use for doing a cost analysis for a contract renewal. RFI, or Request for Information, is a document that solicits information from potential vendors or suppliers about their products, services, or capabilities. RFI is useful for gathering information and data that can help to evaluate and compare different options or alternatives and make informed decisions. However, RFI does not provide a financial forecast or analysis of a project or contract, nor does it calculate the total cost of ownership or the return on investment of each option or alternative. Therefore, RFI is not the best metric to use for doing a cost analysis for a contract renewal. Reference: 1, 2, 3

NEW QUESTION # 490

Which of the following is the BEST example of maintaining 'strategic flexibility'?

- A. Cloud providers need to provide countermeasures to any consequences of not maintaining flexibility of services in a strategic manner.
- B. Cloud provisioning models have a risk of not maintaining flexibility once services have been migrated.
- C. When choosing services to migrate into the cloud, it should be ensured that the cloud provider can change underlying hardware platforms in case the customer needs change.
- D. When choosing services to migrate into the cloud, there should be a focus on ensuring that future migration between different cloud providers can be facilitated.

Answer: D

NEW QUESTION # 491

A company is considering migration to the cloud. It has enabled logging and collection of infrastructure performance. Which of the following will be most influenced by this information?

- A. Baseline
- B. Feasibility study
- C. Proof of concept
- D. Benchmarks

Answer: A

Explanation:

Baseline refers to the collection of data about the current state of infrastructure performance, which is what the company is logging. By gathering performance data, the company establishes a baseline that can be used to measure improvements, compare the performance of the new cloud environment, or identify areas of concern. This baseline data will provide a reference point for assessing the impact of migration to the cloud and ensuring that performance expectations are met.

NEW QUESTION # 492

An organization's servers are experiencing performance degradation from oversubscription of memory in the virtual environment and exhausted physical RAM.

Which of the following cloud computing characteristics would BEST address the issue?

- A. Self-service
- B. Availability
- C. Elasticity
- D. Pay-as-you-go

Answer: C

Explanation:

Elasticity is the cloud computing characteristic that allows the cloud service to scale up or down the resources dynamically according to the demand. Elasticity can help the organization address the issue of performance degradation from oversubscription of memory in the virtual environment and exhausted physical RAM by automatically allocating more memory resources to the servers when needed and releasing them when not needed. This way, the organization can avoid the risk of running out of memory and ensure optimal performance of the servers.
