GH-200 Latest Exam Pdf & GH-200 Test Preparation

Research has found that stimulating interest in learning may be the best solution. Therefore, the GH-200 prepare guide' focus is to reform the rigid and useless memory mode by changing the way in which the GH-200 exams are prepared. Our Soft version of GH-200 practice materials combine knowledge with the latest technology to greatly stimulate your learning power. By simulating enjoyable learning scenes and vivid explanations, users will have greater confidence in passing the qualifying GH-200 exams.

Microsoft GitHub Actions Sample Questions (Q44-Q49):

NEW QUESTION # 44

As a developer, you are optimizing a GitHub workflow that uses and produces many different files. You need to determine when to use caching versus workflow artifacts. Which two statements are true? (Each correct answer presents part of the solution. Choose two.)

- A. Use caching to store cache entries for up to 30 days between accesses.
- **B. Use caching when reusing files that change rarely between jobs or workflow runs.**
- C. Use artifacts to access the GitHub Package Registry and download a package for a workflow.
- **D. Use artifacts when referencing files produced by a job after a workflow has ended.**

Answer: B,D

Explanation:

[B] Use caching when you want to reuse files that don't change often between jobs or workflow runs, such as build dependencies from a package management system.

[D] Use artifacts when you want to save files produced by a job to view after a workflow run has ended, such as built binaries or build logs.

Reference:

<https://docs.github.com/en/enterprise-server@3.16/actions/tutorials/store-and-share-data>

NEW QUESTION # 45

As a developer, which workflow steps should you perform to publish an image to the GitHub Container Registry? (Each correct answer represents part of the solution. Choose three).

- A. Build the container image.
- B. Authenticate to the GitHub Container Registry.
- C. Pull the image from the GitHub Container Registry.
- D. Push the image to the GitHub Container Registry.
- E. Use the actions/setup-docker action.

Answer: A,B,D

Explanation:

Publishing Docker images

The below workflow checks out the GitHub repository, uses the login-action to log in to the registry [B], and then uses the build-push-action to: build a Docker image based on your repository's Dockerfile [E]; push the image to Docker Hub [A], and apply a tag to the image.

Note:

This workflow uses actions that are not certified by GitHub.

They are provided by a third-party and are governed by

separate terms of service, privacy policy, and support

documentation.

GitHub recommends pinning actions to a commit SHA.

To get a newer version, you will need to update the SHA.

You can also reference a tag or branch, but the action may change without warning.

<https://docs.github.com/en/actions/tutorials/publish-packages/publish-docker-images>

NEW QUESTION # 46

Which of the following is the best way for an enterprise to prevent certain marketplace actions from running?

- A. Create a list of the actions that are restricted from being used as an enterprise policy. Every other action can be run.
- B. Create a list that is maintained as a . yml file in a . github repository specified in the enterprise. Only these actions can be run.
- C. Create a list of the actions that are allowed to run as an enterprise policy. Only these actions can be run.
- D. It is not possible; if an action is in the marketplace, its use cannot be restricted.

Answer: C

Explanation:

The best way for an enterprise to control which GitHub Actions run is by creating a list of approved actions as an enterprise policy. This approach restricts workflows to only use the actions that are explicitly allowed, ensuring security and compliance within the organization.

NEW QUESTION # 47

What can be used to set a failed status of an action from its code?

- A. JavaScript dist/ folder
- B. output variable
- C. Dockerfile CMD
- D. composite run step
- E. @actions/github toolkit
- F. a non-zero exit code

Answer: F

Explanation:

Setting exit codes for actions

You can use exit codes to set the status of an action. GitHub displays statuses to indicate passing or failing actions.

About exit codes

GitHub uses the exit code to set the action's check run status, which can be success or failure.

* Exit status: 0

Check run status: success

The action completed successfully and other tasks that depend on it can begin.

* Exit status: Nonzero value (any integer but 0)

Check run status: failure

Any other exit code indicates the action failed. When an action fails, all concurrent actions are canceled and future actions are skipped. The check run and check suite both get a failure status.

Reference:

<https://docs.github.com/en/actions/how-to/create-and-publish-actions/set-exit-codes>

NEW QUESTION # 48

What is the proper syntax to reference the system-provided run number variable?

- A. \$GITHUB_RUN_NUMBER
- B. `${{GITHUB_RUN_NUMBER}}`
- C. `${{env.GITHUB_RUN_NUMBER}}`
- D. `${{var.GITHUB_RUN_NUMBER}}`
- E. \$github.run_number

Answer: B

Explanation:

Default environment variables

The default environment variables that GitHub sets are available to every step in a workflow.

Because default environment variables are set by GitHub and not defined in a workflow, they are not accessible through the env context [Not B]. However, most of the default variables have a corresponding, and similarly named, context property. For example, the value of the GITHUB_REF variable can be read during workflow processing using the `${{ github.ref }}` context property.
