New GitHub-Advanced-Security Study Plan - GitHub-Advanced-Security Vce Test Simulator

Do you want to pass your GitHub Advanced Security GHAS Exam exam? If so, TestInsides is the ideal place to begin. TestInsides provides comprehensive GitHub-Advanced-Security exam questions preparation in two simple formats: a pdf file format and an GitHub GitHub-Advanced-Security online practice test engine. If you fail your GitHub Advanced Security GHAS Exam (GitHub-Advanced-Security) Exam, you can obtain a full refund and a 20% discount! Continue reading to discover more about the essential aspects of these excellent GitHub-Advanced-Security exam questions.

GitHub Advanced Security GHAS Exam Sample Questions (Q53-Q58):

NEW QUESTION # 53

Which of the following features helps to prioritize secret scanning alerts that present an immediate risk?

- A. Non-provider patterns
- B. Custom pattern dry runs
- **C. Secret validation**
- D. Push protection

Answer: C

Explanation:

Secret validation checks whether a secret found in your repository is still valid and active with the issuing provider (e.g., AWS, GitHub, Stripe). If a secret is confirmed to be active, the alert is marked as verified, which means it's considered a high-priority issue because it presents an immediate security risk.

This helps teams respond faster to valid, exploitable secrets rather than wasting time on expired or fake tokens.

NEW QUESTION # 54

What should you do after receiving an alert about a dependency added in a pull request?

- A. Deploy the code to your default branch
- B. Disable Dependabot alerts for all repositories owned by your organization
- C. Update the vulnerable dependencies before the branch is merged
- D. Fork the branch and deploy the new fork

Answer: C

Explanation:

If an alert is raised on a pull request dependency, best practice is to update the dependency to a secure version before merging the PR. This prevents the vulnerable version from entering the main codebase.

Merging or deploying the PR without fixing the issue exposes your production environment to known risks.

NEW QUESTION # 55

Assuming there is no custom Dependabot behavior configured, where possible, what does Dependabot do after sending an alert about a vulnerable dependency in a repository?

- A. Scans repositories for vulnerable dependencies on a schedule and adds those files to a manifest
- B. Constructs a graph of all the repository's dependencies and public dependents for the default branch
- C. Scans any push to all branches and generates an alert for each vulnerable repository
- D. Creates a pull request to upgrade the vulnerable dependency to the minimum possible secure version

Answer: D

Explanation:

After generating an alert for a vulnerable dependency, Dependabot automatically attempts to create a pull request to upgrade that dependency to the minimum required secure version—if a fix is available and compatible with your project.

This automated PR helps teams fix vulnerabilities quickly with minimal manual intervention. You can also configure update behaviors using `dependabot.yml`, but in the default state, PR creation is automatic.

NEW QUESTION # 56

Which of the following benefits do code scanning, secret scanning, and dependency review provide?

- A. Automatically raise pull requests, which reduces your exposure to older versions of dependencies
- B. View alerts about dependencies that are known to contain security vulnerabilities
- C. Confidentially report security vulnerabilities and privately discuss and fix security vulnerabilities in your repository's code
- D. Search for potential security vulnerabilities, detect secrets, and show the full impact of changes to dependencies

Answer: D

Explanation:

These three features provide a complete layer of defense:

* Code scanning identifies security flaws in your source code

* Secret scanning detects exposed credentials

* Dependency review shows the impact of package changes during a pull request Together, they give developers actionable insight into risk and coverage throughout the SDLC.

NEW QUESTION # 57

You have enabled security updates for a repository. When does GitHub mark a Dependabot alert as resolved for that repository?

- A. When Dependabot creates a pull request to update dependencies
- B. When the pull request checks are successful

- C. When you merge a pull request that contains a security update
- D. When you dismiss the Dependabot alert

Answer: C

Explanation:

A Dependabot alert is marked as resolved only after the related pull request is merged into the repository. This indicates that the vulnerable dependency has been officially replaced with a secure version in the active codebase.

Simply generating a PR or passing checks does not change the alert status; merging is the key step.

NEW QUESTION # 58

.....

The software keeps track of the previous GitHub Advanced Security GHAS Exam (GitHub-Advanced-Security) practice exam attempts and shows the changes of each attempt. You don't need to wait days or weeks to get your performance report. The software displays the result of the GitHub GitHub-Advanced-Security Practice Test immediately, which is an excellent way to understand which area needs more attention.
