2025 First-grade Google Google-Workspace-Administrator: Google Cloud Certified - Professional Google Workspace Administrator Exam Practice

In order to help you save more time, we will transfer Google-Workspace-Administrator test guide to you within 10 minutes online after your payment and guarantee that you can study these Google-Workspace-Administrator training materials as soon as possible to avoid time waste. We believe that time is the most valuable things in the world. This is why we are dedicated to improve your study efficiency and production. Here are some advantages of our Google-Workspace-Administrator study question and we would appreciate that you can have a look to our Google-Workspace-Administrator questions.

Google Cloud Certified - Professional Google Workspace Administrator Sample Questions (Q72-Q77):

NEW QUESTION # 72

You are configuring Gmail for your company and want to implement a layered security approach. You decide to implement industry-standard email authentication protocols. What should you do?

Choose 2 answers

- A. Configure a blocked senders rule to block all emails from unknown senders.
- **B. Set up SPF records to specify authorized mail servers for your domain.**
- C. Disable IMAP for your organization to prevent external clients from accessing Gmail.
- D. Enable a default email quarantine for all users to isolate suspicious emails and determine if the messages haven't been authenticated.
- **E. Configure DKIM to digitally sign outbound emails and verify their origin.**

Answer: B,E

Explanation:

To implement industry-standard email authentication protocols as part of a layered security approach for Gmail, you should configure DKIM (DomainKeys Identified Mail) and SPF (Sender Policy Framework) records for your domain. These protocols are crucial for verifying the sender's identity and ensuring the integrity of email messages.

Here's a breakdown of why options C and E are correct and why the others are not primarily email authentication protocols or best practices in this context:

C . Configure DKIM to digitally sign outbound emails and verify their origin.

DKIM adds a digital signature to the headers of outbound emails. This signature is verified by receiving mail servers using a public key published in your domain's DNS records. DKIM helps to confirm that the email was indeed sent from your domain and that its content has not been altered in transit. It is a key email authentication protocol that enhances deliverability and protects against email spoofing.

Associate Google Workspace Administrator topics guides or documents reference: The official Google Workspace Admin Help documentation on "Help prevent email spoofing with DKIM" (or similar titles) explains how to set up DKIM for your domain. It details the process of generating a DKIM key, adding the public key as a TXT record in your DNS, and enabling DKIM signing in the Google Admin console. The documentation emphasizes DKIM's role in authenticating outbound mail and improving email security.

E . Set up SPF records to specify authorized mail servers for your domain.

SPF is a DNS-based email authentication protocol that allows you to specify which mail servers are authorized to send emails on behalf of your domain. Receiving mail servers check the SPF record in the sender's domain's DNS to verify if the sending server's IP address is listed as authorized. This helps to prevent spammers from forging the "From" address of your domain.

Associate Google Workspace Administrator topics guides or documents reference: The Google Workspace Admin Help documentation on "Help prevent spoofing with SPF" (or similar titles) guides administrators on creating and publishing SPF records in their domain's DNS. It explains the syntax of SPF records and how they help receiving servers validate the sender's origin, thus reducing spoofing and improving deliverability.

Now, let's look at why the other options are not the primary choices for implementing industry-standard email authentication protocols:

A . Enable a default email quarantine for all users to isolate suspicious emails and determine if the messages haven't been authenticated.

Email quarantine is a security feature that holds potentially harmful or suspicious emails for review. While it can help manage unauthenticated emails, it is a response to potential authentication failures or suspicious content, not an authentication protocol itself. Quarantine helps in handling emails that fail authentication checks (like SPF or DKIM) or are flagged by other security measures. Associate Google Workspace Administrator topics guides or documents reference: Documentation on Gmail quarantine settings explains how to configure them to manage suspicious emails, including those that may not be properly authenticated. It's a post-authentication handling mechanism.

B . Configure a blocked senders rule to block all emails from unknown senders.

Blocking all emails from "unknown senders" is an overly aggressive and impractical approach for most organizations, as you will likely receive legitimate emails from new contacts or domains. While you can create blocklists, it's not a standard email authentication protocol and can lead to significant disruption of email flow.

Associate Google Workspace Administrator topics guides or documents reference: Gmail's blocking features allow users and administrators to block specific addresses or domains, but blocking all unknown senders is not a recommended security practice. D . Disable IMAP for your organization to prevent external clients from accessing Gmail.

Disabling IMAP can enhance security by limiting how users access their email, potentially reducing the risk of compromised third-party applications. However, it is not an email authentication protocol that verifies the sender of an email. It controls access to the mailbox, not the authentication of emails received or sent.

Associate Google Workspace Administrator topics guides or documents reference: Documentation on managing IMAP and POP access explains how to enable or disable these protocols for users, focusing on access methods rather than email sender authentication.

Therefore, the two correct answers for implementing industry-standard email authentication protocols are configuring DKIM to sign outbound emails and setting up SPF records to specify authorized sending servers.

NEW QUESTION # 73

Your company has acquired a new company in Japan and wants to add all employees of the acquisition to your existing Google Workspace domain. The new company will retain its original domain for email addresses and, due to the very sensitive nature of its work, the new employees should not be visible in the global directory. However, they should be visible within each company's separate directory. What should you do to meet these requirements?

- A. Redesign your OU organization to have 2 child OUs for each company directly under the root. In Directory Settings > Visibility Settings, define custom directories for each company, and set up Visibility according to the OU.
- B. Create a new Google Workspace domain isolated from the existing one, and create users in the new domain instead.
- C. Under Directory Settings > Contact sharing, disable the contact sharing option and wait for 24 hours to allow the settings to propagate before creating the new employee accounts.
- D. Create one dynamic group for each company based on a custom attribute defining the company. In Directory Settings > Visibility Settings, define custom directories for each company, and set up Visibility according to the dynamic group.

Answer: A

NEW QUESTION # 74

As the Workspace Administrator, you have been asked to enable the help desk team to share incoming support requests from end users. The help desk team has ten users who need to respond to support requests that are sent to a help desk email address. The users must be able to respond by email and assign ownership of tickets. Finally, the help desk team is highly mobile and will need to manage help desk tickets from their mobile devices. How would you provide this functionality for the help desk team?

- A. In Google Drive, create a help desk request form, and give the help desk team the ability to view the inbound requests.
- B. Create a help desk Workspace mail account, and set the help desk team as mail delegates to the help desk account.
- C. Create the help desk group as a Q&A Group, and add the "Manager" role to the help desk team users.
- D. Configure a Google Group as a collaborative inbox, and assign the required Groups permissions to the help desk team members.

Answer: D

NEW QUESTION # 75

Your company wants to enable single sign-on (SSO) for its employees to access a newly acquired cloud-based marketing platform. The marketing platform vendor has confirmed SAML 2.0 compatibility and provided the necessary metadata. You need to streamline user access and centralize authentication through Google Workspace. What should you do?

- A. Request an API key from the marketing platform vendor for SAML integration.
- B. Instruct employees to log in to the marketing platform using the Sign In with Google functionality.
- C. Enable two-factor authentication for all users to enhance security before implementing SSO.
- D. Create a new SAML application in the Google Admin console.

Answer: D

Explanation:

To enable single sign-on (SSO) through Google Workspace, you need to create a new SAML application in the Google Admin console. This allows users to authenticate centrally through Google Workspace when accessing the marketing platform, leveraging SAML 2.0 compatibility. You can then upload the metadata provided by the marketing platform vendor to complete the integration. This approach ensures streamlined access and centralized authentication for your employees.

NEW QUESTION # 76

Your company uses Google Workspace and has acquired a subsidiary that, for business reasons, will remain indefinitely on its existing third-party collaboration platform and legacy LDAP system.

This subsidiary operates autonomously with a separate, unfederated Active Directory forest. It is anticipated that interaction between the two companies will be infrequent and primarily conducted via email. Leadership's minimum requirement is adding employees of that subsidiary to your corporate global address book (GAL). What should you do?

- A. Publish a CSV file containing the subsidiary's directory for your users to upload into Google Contacts.
- B. Configure GCDS on the subsidiary LDAP to provision their users with Cloud Identity licenses on the parent domain.
- C. Provision the subsidiary users with G Suite accounts on the parent domain for the additional benefit of allowing collaboration in Drive.
- D. Create a script that uses the Directory API to sync the subsidiary's contact list as shared contacts.

Answer: D

Explanation:

A is not correct because the autonomy requirement and the lack of federation between the Active Directory instances make it almost impossible for this to work properly.

B is correct because domain shared contacts satisfy the requirements of this scenario.

C is not correct because it would be a one-time action performed by end users, and the contacts would not be automatically available domain-wide.

D is not correct because there is no requirement at this time to bring the subsidiary onto the parent's G Suite platform, and it would require licensing.

NEW QUESTION # 77

.....

The service of Google-Workspace-Administrator test guide is very prominent. It always considers the needs of customers in the development process. There are three versions of our Google-Workspace-Administrator learning question, PDF, PC and APP. Each version has its own advantages. You can choose according to your needs. Of course, you can use the trial version of Google-Workspace-Administrator Exam Training in advance. After you use it, you will have a more profound experience. You can choose your favorite our study materials version according to your feelings. When you use Google-Workspace-Administrator test guide, you can also get our services at any time.

Reliable Google-Workspace-Administrator Exam Book: <https://www.trainingdump.com/Google/Google-Workspace-Administrator-practice-exam-dumps.html>

Google Google-Workspace-Administrator practice test is very customizable and you can adjust its time and number of questions. However, every stage of your exam is important, and our company offers the most important Reliable Google-Workspace-Administrator Exam Book - Google Cloud Certified - Professional Google Workspace Administrator updated torrent for your reference. And during preparing for Google-Workspace-Administrator exam you can demonstrate your skills flexibly with your learning experiences. Maybe you are still doubtful about our product, it doesn't matter, but if you try to download our free demo of our Google-Workspace-Administrator exam software first, you will be more confident to pass the exam which is brought by our TrainingDump.

Built on the premise that Speed Kills" QuarkXPress Google-Workspace-Administrator Trusted Exam Resource users will learn how to get twice the work done in half the time, C++ is case sensitive, Google Google-Workspace-Administrator Practice Test is very customizable and you can adjust its time and number of questions.

Quiz 2025 The Best Google-Workspace-Administrator: Google Cloud Certified - Professional Google Workspace Administrator Exam Practice

However, every stage of your exam is important, Google-Workspace-Administrator and our company offers the most important

Google Cloud Certified - Professional Google Workspace Administrator updated torrent for your reference, And during preparing for Google-Workspace-Administrator exam you can demonstrate your skills flexibly with your learning experiences.

Maybe you are still doubtful about our product, it doesn't matter, but if you try to download our free demo of our Google-Workspace-Administrator exam software first, you will be more confident to pass the exam which is brought by our TrainingDump.

TrainingDump guarantees its customers that they can pass the Google-Workspace-Administrator test on the first attempt.
