Pass Guaranteed 2025 Useful CDP-3002: Guide CDP Data Engineer - Certification Exam Torrent

This is a Cloudera CDP-3002 practice exam software for Windows computers. This CDP-3002 practice test will be similar to the

actual CDP-3002 exam. If user wish to test the CDP Data Engineer - Certification Exam (CDP-3002) study material before joining ExamBoosts, they may do so with a free sample trial. This CDP-3002 Exam simulation software can be readily installed on Windows-based computers and laptops. Since it is desktop-based CDP-3002 practice exam software, it is not necessary to connect to the internet to use it.

Cloudera CDP Data Engineer - Certification Exam Sample Questions (Q155-Q160):

NEW QUESTION # 155

You are working with a large dataset consisting of multiple files. How can you efficiently load the data into Spark while considering efficient storage and processing?

- A. Leverage partitioning techniques like `spark.read.textFile("/path/to/directory").repartition(n)`
- B. Use `spark.read.textFile("/path/to/directory/")` to read all files at once
- C. Load each file individually using `spark.read.textFile("/path/to/file")`
- D. All of the above

Answer: A,B

Explanation:

While option A is inefficient for multiple files, option B using a wildcard path efficiently reads all files. Additionally, partitioning C can further improve processing efficiency by aligning data with the number of Spark executors, reducing the need for data shuffling across the network.

NEW QUESTION # 156

How can you ensure that a set of tasks in an Airflow DAG are executed in parallel after a specific initial task is completed?

- A. Use the `SequentialExecutor`
- B. Use the `]]` and `[[` operators to set task dependencies
- C. Use the `parallelism` parameter in the `airflow.cfg` file
- D. Set `depends_on_past=True` for all tasks

Answer: B

Explanation:

The `]]` (bitshift right) and `[[` (bitshift left) operators in Apache Airflow are used to define task dependencies within a DAG. To execute a set of tasks in parallel after an initial task, you can set the initial task to be upstream (using `]]`) of all tasks intended to run in parallel. This ensures the parallel tasks only start after the completion of the initial task, leveraging Airflow's task dependency mechanism.

NEW QUESTION # 157

You need to design a DAG that can be easily scaled horizontally to handle increasing workload. How can you achieve this goal?

- A. Utilize external scheduling tools like Cron to manage DAG execution independently of Airflow workers.
- B. Leverage Airflow pools to manage resource allocation and limit concurrent task execution.
- C. Increase the number of worker processes in the Airflow web server configuration.
- D. Implement custom logic within each task to handle parallel processing independently.

Answer: B,C

NEW QUESTION # 158

What are the potential challenges associated with schema inference in data processing pipelines?

- A. Increased storage costs for schema metadata
- B. The need for manual schema updates
- C. Performance overhead due to schema discovery
- D. Inaccuracies in inferred schemas leading to data processing errors
- E. Handling complex nested structures and arrays

Answer: C,D,E

Explanation:

Schema inference can introduce performance overhead as the system needs to analyze the data to determine its structure.

Inaccuracies in the inferred schema may occur, especially with complex data types or when the data does not follow a consistent format, leading to potential errors in data processing. Handling complex nested structures and arrays can also present challenges, as the inference mechanism must correctly identify these elements within the data.

NEW QUESTION # 159

You are setting up a high-availability Spark cluster and need to configure the master node for recovery using ZooKeeper.

Which configuration should be added to the 'spark-defaults.conf' file?

- A. `spark.deploy.recoveryMode ZOOKEEPER`
- B. `spark.deploy.zookeeper.dir /spark`
- C. `spark.executor.instances 3`
- D. `spark.executor.cores 1`

Answer: A

Explanation:

The 'spark.deploy.recoveryMode ZOOKEEPER' configuration in the 'spark-defaults.conf' file specifies that ZooKeeper will be used for recovery mode in a high-availability setup of Spark. This is essential for enabling the Spark cluster to recover from master node failures.
