- B. The dynamic MAC obtained through the source AC. Address learning in the message. The table entries will age
- C. After the device restarts, the previous dynamic entries will be lost
- D. By viewing the number of specified dynamic MAC. address table entries, you can get the number of users communicating under the interface. After the device restarts, the previous dynamic table entries will be lost

Answer: B,C

NEW QUESTION # 309

On the network shown in the figure, G0/0/0 and G0/0/1 of RTA connect to two different network segments, and RTA is the gateway between the two networks. Given this, the MAC address from which of the following needs to be obtained using an ARP Request message before HostA sends data to HostC?

- A. HostC
- B. G0/0/0 of RTA
- C. SWA
- D. G0/0/1 of RTA

Answer: B

Explanation:

When HostA wants to send data to HostC, the following steps occur:

- * HostA checks if HostC is in the same subnet:
- * HostA and HostC are in different network segments, meaning HostA must send the packet to its default gateway (RTA, G0/0/0) to reach HostC.
- * HostA needs the MAC address of its gateway (RTA G0/0/0):
- * Since ARP (Address Resolution Protocol) is used to resolve IP to MAC addresses, HostA will send an ARP Request to obtain the MAC address of G0/0/0 of RTA.
- * RTA forwards the packet to HostC:
- * Once HostA sends the packet to RTA (using G0/0/0's MAC), RTA will route it to the correct network segment and send it to HostC through G0/0/1.

Why the Other Options Are Incorrect:

- * Option A (HostC) - Incorrect:
- * HostA does not send an ARP request for HostC because HostC is in a different subnet.
- * Option B (G0/0/1 of RTA) - Incorrect:
- * HostA only communicates with its directly connected gateway (G0/0/0), not G0/0/1.
- * Option C (SWA) - Incorrect:
- * Switches (SWA, SWB) operate at Layer 2 and do not require ARP.

Final Answer: D (G0/0/0 of RTA)
