Associate-Cloud-Engineer Test Centres, Associate-Cloud-Engineer Valid Exam Discount

ExamsLabs's Google Associate-Cloud-Engineer exam training materials are bring the greatest success rate to all the candidates who want to pass the exam. Google Associate-Cloud-Engineer exam is a challenging Certification Exam. Besides the books, internet is considered to be a treasure house of knowledge. In ExamsLabs you can find your treasure house of knowledge. This is a site of great help to you. You will encounter the complex questions in the exam, but ExamsLabs can help you to pass the exam easily. ExamsLabs's Google Associate-Cloud-Engineer Exam Training material includes all the knowledge that must be mastered for the purpose of passing the Google Associate-Cloud-Engineer exam.

Google Associate Cloud Engineer Exam Sample Questions (Q138-Q143):

NEW QUESTION # 138

Your company wants to standardize the creation and management of multiple Google Cloud resources using Infrastructure as Code. You want to minimize the amount of repetitive code needed to manage the environment What should you do?

- A. Create a bash script that contains all requirement steps as gcloud commands
- **B. Develop templates for the environment using Cloud Deployment Manager**
- C. Use curl in a terminal to send a REST request to the relevant Google API for each individual resource.
- D. Use the Cloud Console interface to provision and manage all related resources

Answer: B

Explanation:

Explanation

You can use Google Cloud Deployment Manager to create a set of Google Cloud resources and manage them as a unit, called a deployment. For example, if your team's development environment needs two virtual machines (VMs) and a BigQuery database, you can define these resources in a configuration file, and use Deployment Manager to create, change, or delete these resources. You can make the configuration file part of your team's code repository, so that anyone can create the same environment with consistent results.

<https://cloud.google.com/deployment-manager/docs/quickstart>

NEW QUESTION # 139

A colleague handed over a Google Cloud Platform project for you to maintain. As part of a security checkup, you want to review who has been granted the Project Owner role. What should you do?

- A. Enable Audit Logs on the IAM & admin page for all resources, and validate the results.
- B. In the console, validate which SSH keys have been stored as project-wide keys.
- C. Navigate to Identity-Aware Proxy and check the permissions for these resources.
- **D. Use the command `gcloud projects get-iam-policy` to view the current role assignments.**

Answer: D

Explanation:

A simple approach would be to use the command flags available when listing all the IAM policy for a given project. For instance, the following command: ``gcloud projects get-iam-policy $PROJECT_ID --flatten="bindings[].members" --format="table(bindings.members)" --filter="bindings.role.roles/owner"` outputs all the users and service accounts associated with the role 'roles/owner' in the project in question. <https://groups.google.com/g/google-cloud-dev/c/Z6sZs7TvygQ?pli=1>

NEW QUESTION # 140

You have files in a Cloud Storage bucket that you need to share with your suppliers. You want to restrict the time that the files are available to your suppliers to 1 hour. You want to follow Google recommended practices. What should you do?

- A. Create a JSON key for the Default Compute Engine Service Account. Execute the command `gsutil signurl -t 60m gs:///***`
- **B. Create a service account with just the permissions to access files in the bucket. Create a JSON key for the service account. Execute the command `gsutil signurl -d 1h gs:///**`.**
- C. Create a service account with just the permissions to access files in the bucket. Create a JSON key for the service account. Execute the command `gsutil signurl -p 60m gs:///`.
- D. Create a service account with just the permissions to access files in the bucket. Create a JSON key for the service account. Execute the command `gsutil signurl -m 1h gs:///*`.

Answer: B

Explanation:

This command correctly specifies the duration that the signed url should be valid for by using the `-d` flag. The default is 1 hour so omitting the `-d` flag would have also resulted in the same outcome. Times may be specified with no suffix (default hours), or with s = seconds, m = minutes, h = hours, d = days. The max duration allowed is 7d. Ref:

<https://cloud.google.com/storage/docs/gsutil/commands/signurl>

NEW QUESTION # 141

You are working with a user to set up an application in a new VPC behind a firewall. The user is concerned about data egress. You want to configure the fewest open egress ports. What should you do?

- A. Set up a high-priority (1000) rule to allow the appropriate ports.
- **B. Set up a low-priority (65534) rule that blocks all egress and a high-priority rule (1000) that allows only the appropriate ports.**
- C. Set up a high-priority (1000) rule that blocks all egress and a low-priority (65534) rule that allows only the appropriate ports.

- D. Set up a high-priority (1000) rule that pairs both ingress and egress ports.

Answer: B

Explanation:

Implied rules Every VPC network has two implied firewall rules. These rules exist, but are not shown in the Cloud Console: Implied allow egress rule. An egress rule whose action is allow, destination is 0.0.0.0/0, and priority is the lowest possible (65535) lets any instance send traffic to any destination, except for traffic blocked by Google Cloud. A higher priority firewall rule may restrict outbound access. Internet access is allowed if no other firewall rules deny outbound traffic and if the instance has an external IP address or uses a Cloud NAT instance. For more information, see Internet access requirements. Implied deny ingress rule. An ingress rule whose action is deny, source is 0.0.0.0/0, and priority is the lowest possible (65535) protects all instances by blocking incoming connections to them. A higher priority rule might allow incoming access. The default network includes some additional rules that override this one, allowing certain types of incoming connections.

https://cloud.google.com/vpc/docs/firewalls#default_firewall_rules

NEW QUESTION # 142

Your company's infrastructure is on-premises, but all machines are running at maximum capacity.

You want to burst to Google Cloud. The workloads on Google Cloud must be able to directly communicate to the workloads on-premises using a private IP range. What should you do?

- A. In Google Cloud, configure the VPC for VPC Network Peering.
- **B. Set up Cloud VPN between the infrastructure on-premises and Google Cloud.**
- C. In Google Cloud, configure the VPC as a host for Shared VPC.
- D. Create bastion hosts both in your on-premises environment and on Google Cloud. Configure both as proxy servers using their public IP addresses.

Answer: B

Explanation:

Access internal IPs directly

Your VPC network's internal (RFC 1918) IP addresses are directly accessible from your on- premises network with peering, no NAT device or VPN tunnel required.

Hybrid made easy

Today's business climate demands flexibility. Connecting your on-premises resources to your cloud resources seamlessly, with minimum latency or interruption, is a business-critical requirement. The speed and reliability of Cloud Interconnect lets you extend your organization's data center network into Google Cloud, simply and easily, while options such as Cloud VPN provide flexibility for all your workloads. This unlocks the potential of hybrid app development and all the benefits the cloud has to offer.
