WGU Network-and-Security-Foundation Sample Questions (Q50-Q55):

NEW QUESTION # 50

Access to a company's information system requires a user to be within a valid geographic location and to enter a valid username and password.

Which concept does this scenario demonstrate?

- A. User-based accounting
- B. Certificate verification
- C. Single sign-on
- D. Multifactor authentication

Answer: D

Explanation:

Multifactor authentication (MFA) requires users to verify their identity using multiple factors, such as something they know (password), something they have (a token or phone), or somewhere they are (geolocation-based access control). Requiring both location verification and password authentication demonstrates MFA.

* Certificate verification checks digital certificates for security but does not use multiple authentication factors.

* User-based accounting logs user activities but does not verify identity.

* Single sign-on (SSO) allows access to multiple systems with one login but is not necessarily MFA.

NEW QUESTION # 51

A company's internal messaging system is being redesigned. The authentication procedures were so cumbersome that employees were using personal email to communicate.

What is the security principle implemented in this scenario?

- **A. Psychological acceptability**
- B. Zero-trust model
- C. Fail-safe
- D. Least common mechanism

Answer: A

Explanation:

Psychological acceptability states that security measures should be user-friendly and not overly burdensome.

If security controls are too complex, users may bypass them, leading to weaker security. In this case, employees used personal email because authentication procedures were too cumbersome.

* Zero-trust model enforces strict access control, not usability.

* Least common mechanism limits shared resources.

* Fail-safe ensures secure failure handling, not usability.

NEW QUESTION # 52

Which scenario demonstrates a violation of the integrity component of the CIA triad?

- A. A company has an unacceptably high network downtime during high-traffic time periods.
- B. A company stores sensitive customer data without access controls.
- **C. An employee accidentally modified a customer account incorrectly.**
- D. A network's domain name system server has not been fully operational for one month.

Answer: C

Explanation:

A violation of integrity occurs when data is modified incorrectly, whether intentionally or by accident. In this case, an employee modifying a customer account incorrectly demonstrates a breach of data integrity.

* A and C relate to availability, as they describe system downtime.

* D relates to confidentiality, as it describes improper data protection.

NEW QUESTION # 53

An organization has experienced a series of data breaches and needs to ensure that data remains protected even if intercepted. Which security measure should be implemented?

- A. Patch management
- B. Role-based access control (RBAC)
- C. Two-factor authentication (2FA)
- **D. Data encryption**

Answer: D

Explanation:

Data encryption protects sensitive information by encoding it into an unreadable format, ensuring that even if attackers intercept the data, they cannot decipher it without the proper decryption key. This is crucial for protecting stored and transmitted data.

* RBAC controls user access but does not secure data in transit.

* 2FA strengthens authentication but does not secure stored or transmitted data.

* Patch management fixes software vulnerabilities but does not directly protect intercepted data.

NEW QUESTION # 54

Which layer of the OSI model includes the TCP?

- A. Session
- **B. Transport**
- C. Network
- D. Application

Answer: B

Explanation:

The Transport layer (Layer 4 of the OSI model) includes the Transmission Control Protocol (TCP), which provides reliable, connection-oriented communication. TCP ensures error-checking, sequencing, and retransmission of lost packets.

* Application layer deals with end-user protocols like HTTP and FTP.

* Session layer manages communication sessions but not transport protocols.

* Network layer focuses on IP addressing and routing, not transport mechanisms.
