**Pass Guaranteed Quiz NCP-US-6.5 - Updated Exam Nutanix Certified**

## Professional - Unified Storage (NCP-US) v6.5 Passing Score

The PrepAwayExam is one of the top-rated and trusted platforms that are committed to making the entire Nutanix NCP-US-6.5 exam preparation journey fast and successful. To achieve this goal the "PrepAwayExam" is offering valid, updated, and real Nutanix NCP-US-6.5 Exam Questions. These PrepAwayExam NCP-US-6.5 exam questions are checked and verified by qualified subject matter experts.

### Nutanix Certified Professional - Unified Storage (NCP-US) v6.5 Sample Questions (Q106-Q111):

#### NEW QUESTION # 106

An administrator has created a distributed share on the Files cluster. The administrator connects to the share using Windows Explorer and starts creating folders in the share. The administrator observes that none of the created folders can be renamed as the company naming convention requires. How should the administrator resolve this issue?

- A. Modify the Files shares to use the NFS protocol.
- **B. Modify the read/write permissions on the created folders.**
- C. Use the Microsoft Shared Folder MMC Snap-in.
- D. Use the Files MMC Snap-in and rename the folders.

**Answer: B**

Explanation:

Nutanix Files, part of Nutanix Unified Storage (NUS), supports distributed shares that span multiple File Server Virtual Machines (FSVMs) for scalability (as discussed in Questions 16 and 30). The administrator has created a distributed share, accessed it via Windows Explorer (implying SMB protocol), and created folders.

However, the folders cannot be renamed to meet the company's naming convention, indicating a permissions issue.

Understanding the Issue:

- \* Distributed Share: A distributed share in Nutanix Files is accessible via SMB or NFS and spans multiple FSVMs.
- \* Windows Explorer (SMB): The administrator is using Windows Explorer, indicating the share is accessed via SMB.
- \* Cannot Rename Folders: The inability to rename folders suggests a permissions restriction, likely because the user account used to create the folders does not have sufficient permissions to modify them (e.g., rename).
- \* Company Naming Convention: The requirement to rename folders to meet a naming convention implies the administrator needs full control over the folders, which may not be granted by the current permissions.

Analysis of Options:

- \* Option A (Use the Microsoft Shared Folder MMC Snap-in): Incorrect. The Microsoft Shared Folder MMC Snap-in (e.g., via Computer Management) allows management of SMB shares on a Windows server, but Nutanix Files shares are managed through the Files Console or FSVMs, not a Windows server. While this tool can view shares, it does not provide a mechanism to resolve renaming issues caused by permissions on a Nutanix Files share.
- \* Option B (Use the Files MMC Snap-in and rename the folders): Incorrect. There is no "Files MMC Snap-in" for Nutanix Files. Nutanix Files is managed via the Files Console in Prism Central or through CLI/FSVM access. This option appears to be a misnomer and does not provide a valid solution for renaming folders.
- \* Option C (Modify the read/write permissions on the created folders): Correct. The inability to rename folders in an SMB share is typically due to insufficient permissions. When the administrator created the folders via Windows Explorer, the default permissions (inherited from the share or parent folder) may not grant the necessary rights (e.g., "Modify" or "Full Control") to rename them. The administrator should modify the permissions on the created folders to grant the required rights (e.g., Full Control) to the user account or group, allowing renaming to meet the company naming convention. This can be done via Windows Explorer (Properties > Security tab) or through the Files Console by adjusting share/folder permissions.
- \* Option D (Modify the Files shares to use the NFS protocol): Incorrect. Switching the share to use NFS instead of SMB would require reconfiguring the share and client access, which is unnecessary and disruptive. The issue is with permissions, not the protocol, and SMB supports folder renaming if the correct permissions are set. Additionally, NFS may introduce other complexities (e.g., Unix permissions) that do not address the core issue.

Why Option C?

The inability to rename folders in an SMB share is a permissions issue. Modifying the read/write permissions on the created folders to grant the administrator (or relevant user/group) the necessary rights (e.g., Modify or Full Control) allows renaming, resolving the issue and enabling compliance with the company naming convention. This can be done directly in Windows Explorer or via the Files Console.

Exact Extract from Nutanix Documentation:

From the Nutanix Files Administration Guide (available on the Nutanix Portal):

"If users cannot rename folders in an SMB share on Nutanix Files, this is typically due to insufficient permissions. Modify the read/write permissions on the affected folders to grant the necessary rights (e.g., Modify or Full Control) to the user or group. Permissions can be adjusted via Windows Explorer (Properties > Security) or through the Files Console by editing share or folder permissions."

:

Nutanix Files Administration Guide, Version 4.0, Section: "Managing Permissions for SMB Shares" (Nutanix Portal).

Nutanix Certified Professional - Unified Storage (NCP-US) Study Guide, Section: "Nutanix Files Share Permissions".

#### NEW QUESTION # 107

Which protocols are supported by Files?

- A. SMBv2 SMBv3, NFSv2, NFSv3
- B. SMBv1. SMBv2, NFSv3, NFSv4
- **C. SMBv2 SMBv3, NFSv3, NFSv4**
- D. SMBv1. SMBv2, NFSv2, NFSv3

**Answer: C**

Explanation:

The protocols that are supported by Files are SMBv2, SMBv3, NFSv3, and NFSv4. SMB (Server Message Block) is a protocol that allows clients to access files, printers, and other resources on a network. NFS (Network File System) is a protocol that allows clients to access files on a remote server as if they were local.

Files supports both SMB and NFS protocols for creating shares and exports that can be accessed by different types of clients.

#### NEW QUESTION # 108

An administrator needs to protect a Files cluster unique policies for different shares.

How should the administrator meet this requirement?

- **A. Configure data protection policies in the Files view in Prism Central.**
- B. Configure data protection policies in File Server view in Prism Element
- C. Create a protection domain in the Data Protection view in Prism Central.
- D. Create a protection domain in the Data Protection view in Prism Element.

**Answer: A**

Explanation:

The administrator can meet this requirement by configuring data protection policies in the Files view in Prism Central. Data protection policies are policies that define how file data is protected by taking snapshots, replicating them to another site, or tiering them to cloud storage. Data protection policies can be configured for each share or export in a file server in the Files view in Prism Central. The administrator can create different data protection policies for different shares or exports based on their protection needs and requirements. #### NEW QUESTION # 109

Which ransomware prevention solution for Files is best when the list of malicious file signatures to block is greater than 300?

- A. File Analytics
- B. Data Lens
- **C. Third-party solution**
- D. Flow Security Central

**Answer: C**

Explanation:

Nutanix Files provides a built-in ransomware prevention feature that allows administrators to block malicious file signatures from being written to the file system. However, this feature has a limit of 300 signatures per share or export. If the list of malicious file signatures to block is greater than 300, a third-party solution is recommended. ### NEW QUESTION # 110

The Administrator needs to review the following graphs, as displayed in the exhibit.

- \* Storage Used
- \* Open Connections
- \* Number of Files
- \* Top Shares by Current Capacity
- \* Top Shares by current Connections

Where should the administrator complete this action?

- A. Files Console Data Management View
- B. Files Console Share View
- C. Files Console Monitoring View
- **D. Files Console Dashboard View**

**Answer: D**

Explanation:

The Files Console Dashboard View provides an overview of the Files cluster performance and usage, including the following graphs:

- \* Storage Used: Shows the total storage used by the Files cluster, including data, metadata, and snapshots.
  - \* Open Connections: Shows the number of active SMB and NFS connections to the Files cluster.
  - \* Number of Files: Shows the number of files stored in the Files cluster, excluding snapshots.
  - \* Top Shares by Current Capacity: Shows the top five shares by current capacity usage in the Files cluster.
  - \* Top Shares by Current Connections: Shows the top five shares by current connection count in the Files cluster.
