VMware Advanced Deploy VMware NSX-T Data Center 3.X - 3V0-41.22 Exam Questions

QUESTION NO: 6
Task 16
You are working to automate your NSX-T deployment and an automation engineer would like to retrieve your BGP routing information from the API.
You need to:
* Run the GET call in the API using Postman
* Save output to the desktop to a text file called API.txt
Complete the requested task.
Notes: Passwords are contained in the user _ readme.txt. This task is not dependent on another. This task should take approximately 5 minutes to complete.

Hide answers/explanation

Correct Answer:

See the Explanation part of the Complete Solution and step by step instructions.
Explanation
To run the GET call in the API using Postman and save the output to the desktop to a text file called API.txt, you need to follow these steps:
Open Postman and create a new request tab. Select GET as the method from the drop-down menu.
Enter the URL of the NSX-T Policy API endpoint for retrieving the BGP routing table, such as https://<nsx-manager-ip-address>/policy/api/v1/infra/tier-0s/vmc/routing-table?enforcement_point_path=/ Click the Authorization tab and select Basic Auth as the type from the drop-down menu. Enter your NSX-T username and password in the Username and Password fields, such as admin and VMware1!.
Click Send to execute the request and view the response in the Body tab. You should see a JSON object with the BGP routing table information, such as routes, next hops, prefixes, etc.
Click Save Response and select Save to a file from the drop-down menu. Enter API.txt as the file name and choose Desktop as the location. Click Save to save the output to your desktop.
You have successfully run the GET call in the API using Postman and saved the output to your desktop to a text file called API.txt.

QUESTION NO: 7
Task 11
upon testing the newly configured distributed firewall policy for the Boston application, it has been discovered that the Boston-Web virtual machines can be "pinged" via ICMP from the main console. Corporate policy does not allow pings to the Boston VMs.
You need to:
* Troubleshoot ICMP traffic and make any necessary changes to the Boston application security policy.
Complete the requested task.
Notes: Passwords are contained in the user _readme.txt. This task is dependent on Task 5.

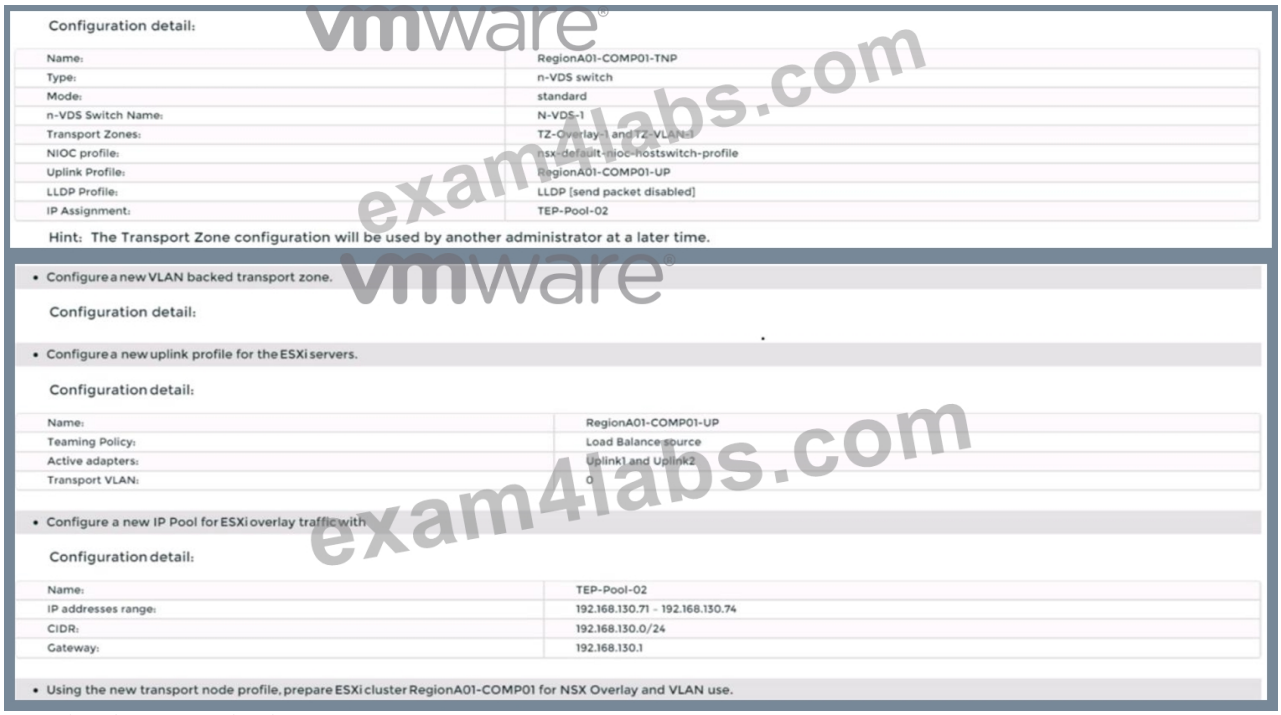
VMware 3V0-41.22 Exam Topics | 3V0-41.22 Reliable Test Pattern

The desktop software Advanced Deploy VMware NSX-T Data Center 3.X (3V0-41.22) practice exam format can be used easily used on your Windows system. Customers can use it without the internet. Exam4Labs have made all of the different formats so the students won't face any extra issues and crack Advanced Deploy VMware NSX-T Data Center 3.X (3V0-41.22) certification exams for the betterment of their futures.

VMware Advanced Deploy VMware NSX-T Data Center 3.X Sample Questions (Q11-Q16):

NEW QUESTION # 11
SIMULATION
Task 1
You are asked to prepare a VMware NSX-T Data Center ESXi compute cluster Infrastructure. You will prepare two ESXi servers in a cluster for NSX-T overlay and VLAN use.
All configuration should be done using the NSX UI.
* NOTE: The configuration details in this task may not be presented to you in the order in which you must complete them.
* Configure a new Transport Node profile and add one n-VDS switch. Ensure Uplink 1 and Uplink 2 of your configuration use vmnic2 and vmnic3 on the host.



Complete the requested task.
NOTE: Passwords are contained in the user_readme.txt. Configuration details may not be provided in the correct sequential order. Steps to complete this task must be completed in the proper order. Other tasks are dependent on the completion Of this task. You may want to move to other tasks/steps while waiting for configuration changes to be applied. This task should take approximately 20 minutes to complete.

Answer:

Explanation:
See the Explanation part of the Complete Solution and step by step instructions Explanation:
To prepare a VMware NSX-T Data Center ESXi compute cluster infrastructure, you need to follow these steps:
Log in to the NSX Manager UI with admin credentials. The default URL is https://<nsx-manager-ip-address>.
Navigate to System > Fabric > Profiles > Transport Node Profiles and click Add Profile.
Enter a name and an optional description for the transport node profile.
In the Host Switches section, click Set and select N-VDS as the host switch type.
Enter a name for the N-VDS switch and select the mode as Standard or Enhanced Datapath, depending on your requirements.
Select the transport zones that you want to associate with the N-VDS switch. You can select one overlay transport zone and one or more VLAN transport zones.
Select an uplink profile from the drop-down menu or create a custom one by clicking New Uplink Profile.
In the IP Assignment section, select Use IP Pool and choose an existing IP pool from the drop-down menu or create a new one by clicking New IP Pool.
In the Physical NICs section, map the uplinks to the physical NICs on the host. For example, map Uplink 1 to vmnic2 and Uplink 2

to vmnic3.
Click Apply and then click Save to create the transport node profile.
Navigate to System > Fabric > Nodes > Host Transport Nodes and click Add Host Transport Node.
Select vCenter Server as the compute manager and select the cluster that contains the two ESXi servers that you want to prepare for NSX-T overlay and VLAN use.
Select the transport node profile that you created in the previous steps and click Next.
Review the configuration summary and click Finish to start the preparation process.
The preparation process may take some time to complete. You can monitor the progress and status of the host transport nodes on the Host Transport Nodes page. Once the preparation is complete, you will see two host transport nodes with a green status icon and a Connected state. You have successfully prepared a VMware NSX-T Data Center ESXi compute cluster infrastructure using a transport node profile.

NEW QUESTION # 12
Task 6
You are asked to integrate NSX manager with LDAP to better control NSX administrators' roles and responsibilities. Ensure users can manage the NSX environment utilizing Active Directory login credentials.
You need to:
* Configure NSX Manager LDAP integration to the corp.local domain using the following configuration detail:

* Configure the user nsx-admin@corp.local Active Directory account as an Enterprise Admin access role.
Complete the requested task.
Notes:
Passwords are contained in the user_readme.txt. You may want to move to other tasks/steps while waiting for configuration changes to be applied. This task should take approximately 15 minutes to complete.

Answer:

Explanation:
See the Explanation part of the Complete Solution and step by step instructions.
Explanation
To integrate NSX Manager with LDAP to better control NSX administrators' roles and responsibilities, you need to follow these steps:
Log in to the NSX Manager UI with admin credentials. The default URL is https://<nsx-manager-ip-address>.
Navigate to System > User Management > LDAP and click Add Identity Source.
Enter a name for the identity source, such as corp.local.
Enter the domain name of your Active Directory server, such as DC=corp,DC=local.
Select Active Directory over LDAP as the type from the drop-down menu.
Click Set to configure LDAP servers. You can add up to three LDAP servers for failover support, to each domain.
Enter the hostname or IP address of your LDAP server, such as corpdcserver.corp.local.
Select LDAP as the protocol from the drop-down menu.
Enter the port number for the LDAP server, such as 389.
Click Connection Status to test the connection to the LDAP server. If successful, you will see a green check mark and a message saying "Connection successful".
Optionally, you can enable StartTLS to use encryption for the LDAP connection. To do this, toggle the Use StartTLS button and enter the certificate of the LDAP server in PEM format in the text box below.
Click Save to add the LDAP server.
Repeat steps 6 to 12 to add more LDAP servers if needed.
Enter the bind entry user name and password for the LDAP server, such as Administrator@corp.local and VMware1!.
Click Save to create the identity source.
Navigate to System > User Management > Users and Roles and click Add Role Assignment for LDAP.

Select corp.local as the domain from the drop-down menu.
Enter nsx-admin@corp.local in the search box and select it from the list that appears.
Select Enterprise Admin as the role from the drop-down menu.
Click Save to assign the role to the user.
You have successfully integrated NSX Manager with LDAP and configured nsx-admin@corp.local Active Directory account as an Enterprise Admin access role.

NEW QUESTION # 13
Task 1
You are asked to prepare a VMware NSX-T Data Center ESXi compute cluster Infrastructure. You will prepare twoESXiservers in a cluster for NSX-T overlay and VLAN use.
All configuration should be done using the NSX UI.
* NOTE: The configuration details in this task may not be presented to you in the order in which you must complete them.

Once the preparation is complete, you will see two host transport nodes with a green status icon and a Connected state.You have successfully prepared a VMware NSX-T Data Center ESXi compute cluster infrastructure using a transport node profile.

NEW QUESTION # 14
Task 12
An issue with the Tampa web servers has been reported. You would like to replicate and redirect the web traffic to a network monitoring tool outside Of the NSX-T environment to further analyze the traffic.
You are asked to configure traffic replication to the monitoring software for your Tampa web overlay segments with bi-directional traffic using this detail:

Session Name:	Network-Monitor-01
Network Appliance Name/Group:	NM-01
Direction:	Bi Directional
TCP/IP Stack:	Default
Encapsulation Type:	GRE

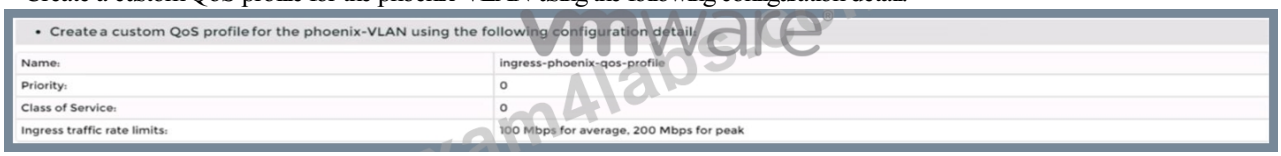
Complete the requested configuration.
Notes: Passwords are contained in the user_readme.txt. This task is not dependent on other tasks. This task should take approximately 10 minutes to complete.

Answer:

Explanation:
See the Explanation part of the Complete Solution and step by step instructions.
Explanation
To configure traffic replication to the monitoring software for your Tampa web overlay segments with bi-directional traffic, you need to follow these steps:
Log in to the NSX Manager UI with admin credentials. The default URL is https://<nsx-manager-ip-address>.
Navigate to Networking > Segments and select the Tampa web overlay segment that you want to replicate the traffic from. For example, select Web-01 segment that you created in Task 2.
Click Port Mirroring > Set > Add Session and enter a name and an optional description for the port mirroring session. For example, enter Tampa-Web-Monitoring.
In the Direction section, select Bi-directional as the direction from the drop-down menu. This will replicate both ingress and egress traffic from the source to the destination.
In the Source section, click Set and select the VMs or logical ports that you want to use as the source of the traffic. For example, select Web-VM-01 and Web-VM-02 as the source VMs. Click Apply.
In the Destination section, click Set and select Remote L3 SPAN as the destination type from the drop-down menu. This will allow you to replicate the traffic to a remote destination outside of the NSX-T environment.
Enter the IP address of the destination device where you have installed the network monitoring software, such as 10.10.10.200.
Select an existing service profile from the drop-down menu or create a new one by clicking New Service Profile. A service profile defines the encapsulation type and other parameters for the replicated traffic.
Optionally, you can configure advanced settings such as TCP/IP stack, snap length, etc., for the port mirroring session.
Click Save and then Close to create the port mirroring session.
You have successfully configured traffic replication to the monitoring software for your Tampa web overlay segments with bi-directional traffic using NSX-T Manager UI.

NEW QUESTION # 15
SIMULATION
Task 7

you are asked to create a custom QoS profile to prioritize the traffic on the phoenix-VLAN segment and limit the rate of ingress traffic.
You need to:
* Create a custom QoS profile for the phoenix-VLAN using the following configuration detail:



- Create a custom QoS profile for the phoenix-VLAN using the following configuration detail:

Name:	ingress-phoenix-qos-profile
Priority:	0
Class of Service:	0
Ingress traffic rate limits:	100 Mbps for average, 200 Mbps for peak

* Apply the profile on the 'phoenix-VLAN' segment
Complete the requested task.
Notes: Passwords are contained in the user_readme.txt.
take approximately 5 minutes to complete.
Subsequent tasks may require the completion of this task. This task should

Answer:

Explanation:
See the Explanation part of the Complete Solution and step by step instructions Explanation:
To create a custom QoS profile to prioritize the traffic on the phoenix-VLAN segment and limit the rate of ingress traffic, you need to follow these steps:
Log in to the NSX Manager UI with admin credentials. The default URL is https://<nsx-manager-ip-address>.
Navigate to Networking > Segments > Switching Profiles and click Add Switching Profile. Select QoS as the profile type.
Enter a name and an optional description for the QoS profile, such as phoenix-QoS.
In the Mode section, select Untrusted as the mode from the drop-down menu. This will allow you to set a custom DSCP value for the outbound IP header of the traffic on the segment.
In the Priority section, enter 46 as the DSCP value. This will mark the traffic with Expedited Forwarding (EF) per-hop behavior, which is typically used for high-priority applications such as voice or video.
In the Class of Service section, enter 5 as the CoS value. This will map the DSCP value to a CoS value that can be used by VLAN-based logical ports or physical switches to prioritize the traffic.
In the Ingress section, enter 1000000 as the Average Bandwidth in Kbps. This will limit the rate of inbound traffic from the VMs to the logical network to 1 Mbps.
Optionally, you can also configure Peak Bandwidth and Burst Size settings for the ingress traffic, which will allow some burst traffic above the average bandwidth limit for a short duration.
Click Save to create the QoS profile.
Navigate to Networking > Segments and select the phoenix-VLAN segment that you want to apply the QoS profile to.
Click Actions > Apply Profile and select phoenix-QoS as the switching profile that you want to apply to the segment.
Click Apply to apply the profile to the segment.
You have successfully created a custom QoS profile and applied it to the phoenix-VLAN segment.

NEW QUESTION # 16
.....

This is another of the benefits of the command line under Linux—you 3V0-41.22 can string several commands together to get the desired results, For more information on rule storage, see Creating Rules, p.
