P.S. Free 2025 HP HPE6-A85 dumps are available on Google Drive shared by Test4Cram: <https://drive.google.com/open?id=1kpUoqt2H9xc1TrgtAT2iwQPKvybLwGN>

With the HP HPE6-A85 PDF questions file, you can prepare for the HP HPE6-A85 test on the go since the format is portable and works with all smart devices. The HP HPE6-A85 probable exam questions in PDF save you time so that you do not have to go through sleepless nights owing to a tight daily routine.

HP HPE6-A85 (Aruba Campus Access Associate) Certification Exam is designed to test an individual's knowledge and skills in implementing and managing Aruba wireless networks in a campus environment. HPE6-A85 exam covers a range of topics including network fundamentals, wireless LAN design, and configuration, troubleshooting, and security. Passing the exam demonstrates that an individual has the competence and technical expertise to configure and maintain a complex wireless network.

HP HPE6-A85 Web-Based Practice Exam - Reliable Online Self-Assessment Test

After you purchase our HPE6-A85 study material, you must really absorb the content in order to pass the exam. Our HPE6-A85 guide quiz really wants you to learn something and achieve your goals. And it is easy and convenient for you to make it. For we have three versions of the HPE6-A85 Exam Questions for you to choose: the PDF, Software and APP online. So that you can study at

any time you like. And the content of the HPE6-A85 learning braindumps is also simplified for you to easily understand.

HP Aruba Campus Access Associate Exam Sample Questions (Q53-Q58):

NEW QUESTION # 53

Which Protocol Data Unit (PDU) represents the network layer PDU?

- A. PDU2 - Frame
- **B. PDU3 - Packet**
- C. PDU1 - Signal
- D. PDU4 - Segment

Answer: B

Explanation:

In the context of the OSI model, the network layer is responsible for packet forwarding including routing through intermediate routers. Hence, the network layer PDU is known as a packet.

NEW QUESTION # 54

You need to drop excessive broadcast traffic on ingress to an ArubaOS-CX switch. What is the best technology to use for this task?

- A. QoS shaping
- B. DWRR queuing
- **C. Rate limiting**
- D. Strict queuing

Answer: C

Explanation:

Explanation

The best technology to use for dropping excessive broadcast traffic on ingress to an ArubaOS-CX switch is rate limiting. Rate limiting is a feature that allows network administrators to control the amount of traffic that enters or leaves a port or a VLAN on a switch by setting bandwidth thresholds or limits. Rate limiting can be used to prevent network congestion, improve network performance, enforce service level agreements (SLAs), or mitigate denial-of-service (DoS) attacks. Rate limiting can be applied to broadcast traffic on ingress to an ArubaOS-CX switch by using the storm-control command in interface configuration mode. This command allows network administrators to specify the percentage of bandwidth or packets per second that can be used by broadcast traffic on an ingress port. If the broadcast traffic exceeds the specified threshold, the switch will drop the excess packets. The other options are not technologies for dropping excessive broadcast traffic on ingress because:

DWRR queuing: DWRR stands for Deficit Weighted Round Robin, which is a queuing algorithm that assigns different weights or priorities to different traffic classes or queues on an egress port. DWRR ensures that each queue gets its fair share of bandwidth based on its weight while avoiding starvation of lower priority queues. DWRR does not drop excessive broadcast traffic on ingress, but rather schedules outgoing traffic on egress.

QoS shaping: QoS stands for Quality of Service, which is a set of techniques that manage network resources and provide different levels of service to different types of traffic based on their requirements.

QoS shaping is a technique that delays or buffers outgoing traffic on an egress port to match the available bandwidth or rate limit.

QoS shaping does not drop excessive broadcast traffic on ingress, but rather smooths outgoing traffic on egress.

Strict queuing: Strict queuing is another queuing algorithm that assigns different priorities to different traffic classes or queues on an egress port. Strict queuing ensures that higher priority queues are always served before lower priority queues regardless of their bandwidth requirements or weights. Strict queuing does not drop excessive broadcast traffic on ingress, but rather schedules outgoing traffic on egress.

NEW QUESTION # 55

A network technician is troubleshooting one new AP at a branch office that will not receive its configuration from Aruba Central. The

other APs at the branch are working as expected. The output of the 'show ap debug cloud-server command' shows that the "cloud config received" is FALSE.

After confirming the new AP has internet access, what would you check next?

- A. Disable and enable Aruba Central to trigger configuration refresh
- **B. Disable and enable activate to trigger provisioning refresh**
- C. Verify the AP has a license assigned
- D. Verify the AP can ping the device on arubanetworks.com

Answer: B

Explanation:

When an Aruba AP is not receiving its configuration from Aruba Central, and other APs at the location are functioning normally, a common troubleshooting step is to disable and then re-enable the activation process on the AP. This action can trigger a provisioning refresh, prompting the AP to attempt to retrieve its configuration from Aruba Central again. This step is often effective in resolving communication or provisioning issues between the AP and the management platform.

NEW QUESTION # 56

When would you bond multiple 20MHz wide 802.11 channels?

- A. To decrease the Signal to Noise Ratio (SNR)
- B. To utilize high gain omni-directional antennas
- C. To provision highly available AP groups
- **D. To increase throughput between the client and AP**

Answer: D

Explanation:

Bonding multiple 20MHz wide 802.11 channels is a technique to create a wider bandwidth channel that supports higher data rate transmissions. It can increase the throughput between the client and AP by using more spectrum resources and reducing interference. References: <https://ieeexplore.ieee.org/document/9288995>

NEW QUESTION # 57

When using Aruba Central what can identify recommended steps to resolve network health issues and allows you to share detailed information with support personnel?

- A. Audit Trail
- **B. OAIops**
- C. Overview Dashboard
- D. Alerts and Events

Answer: B

Explanation:

Explanation

OAIops is a feature of Aruba Central that uses artificial intelligence and machine learning to identify recommended steps to resolve network health issues and allows you to share detailed information with support personnel. OAIops provides insights into network performance, root cause analysis, anomaly detection, proactive alerts, and automated remediation actions. OAIops also integrates with Aruba User Experience Insight (UXI) sensors to measure and improve user experience across wired and wireless networks.
