

HPE6-A85 Guaranteed Questions Answers, HPE6-A85 Study Guide Pdf

HP HPE6-A85 Practice Questions

Aruba Certified Campus Access Associate Exam

Order our HPE6-A85 Practice Questions Today and Get Ready to Pass with Flying Colors!

HPE6-A85 Practice Exam Features | QuestionsTube

- Latest & Updated Exam Questions
- Subscribe to FREE Updates
- Both PDF & Exam Engine
- Download Directly Without Waiting

<https://www.questionstube.com/exam/hpe6-a85/>

At QuestionsTube, you can read HPE6-A85 free demo questions in pdf file, so you can check the questions and answers before deciding to download the HP HPE6-A85 practice questions. These free demo questions are parts of the HPE6-A85 exam questions. Download and read them carefully, you will find that the HPE6-A85 test questions of QuestionsTube will be your great learning materials online. Share some HPE6-A85 exam online questions below.

1. You put in a few show commands on switches EDGE1 and CORE1 to attempt to gather information

What's more, part of that Itcerttest HPE6-A85 dumps now are free: https://drive.google.com/open?id=1hxytrtrLRYZg2cLlBBmE_v44arC5uXB7

Getting tired of humdrum life, you may want to get some successful feeling or try something different instead. We all know that is of important to pass the HPE6-A85 exam and get the HPE6-A85 certification for someone who wants to find a good job in internet area, and it is not a simple thing to prepare for exam. So you are in the right place now. The HPE6-A85 practice materials are a great beginning to prepare your exam. Actually, just think of our HP practice materials as the best way to pass the exam is myopic. They can not only achieve this, but ingeniously help you remember more content at the same time.

This format of Itcerttest HP HPE6-A85 practice material is compatible with these smart devices: Laptops, Tablets, and Smartphones. This compatibility makes HPE6-A85 PDF Dumps easily usable from any place. It contains real and latest HPE6-A85 exam questions with correct answers. Itcerttest examines it regularly for new updates so that you always get new Aruba Campus Access Associate Exam (HPE6-A85) practice questions. Since it is a printable format, you can do a paper study. The Aruba Campus Access Associate Exam (HPE6-A85) PDF Dumps document is accessible from every location at any time.

HPE6-A85 Study Guide Pdf, Braindump HPE6-A85 Free

As we all know that if you can obtain the HPE6-A85 certification, your life will change from now on. There will be various opportunities waiting for you. You take the initiative. It is up to you to make a decision. We only live once. Don't postpone your purpose and dreams. Our HPE6-A85 Real Exam will escort your dreams. You will get better jobs as well as higher salaries to lead a better life. Come to fight for your bright future and buy our HPE6-A85 practice braindumps right now!

HPE6-A85 exam covers a wide range of topics related to Aruba wireless networks, including ArubaOS, radio frequency (RF) fundamentals, wireless LAN (WLAN) design, security, and troubleshooting. Candidates who pass the exam will demonstrate their ability to configure and deploy Aruba wireless networks, troubleshoot common network issues, and implement best practices for network security.

HPE6-A85 Exam is a globally recognized certification that validates the skills and knowledge of network professionals. It is suitable for IT professionals who work with Aruba network access points, controllers, and Mobility Master appliances. Aruba Campus Access Associate Exam certification is ideal for network administrators, network engineers, help desk technicians, and any other IT professionals who are looking to expand their knowledge of wireless networking and Aruba network access control. Passing HPE6-A85 Exam will enable professionals to demonstrate their expertise in Aruba network solutions and enhance their career prospects.

HP Aruba Campus Access Associate Exam Sample Questions (Q64-Q69):

NEW QUESTION # 64

Which of the following is a primary security feature supported by Aruba switches?

- A. Web content filtering.
- **B. Role-based access control.**
- C. All are correct.
- D. Built-in intrusion prevention system.

Answer: B

NEW QUESTION # 65

Review the configuration below.

```
Core-1(config)# interface loopback 0
Core-1(config-if)# ip address 10.1.200.1/32
Core-1(config)# router ospf 1
Core-1(config-ospf-1)# router-id 10.1.200.1
Core-1(config-ospf-1)# area 0
Core-1(config-ospf-1)# exit
```

Why would you configure OSPF to use the IP address 10.1.200.1 as the router ID?

- A. The IP address associated with the loopback interface is non-routable and prevents loops
- **B. The loopback interface state is independent of any physical interface and reduces routing updates.**
- C. The IP address associated with the loopback interface is routable and prevents loops
- D. The loopback interface state is dependent on the management interface state and reduces routing updates.

Answer: B

Explanation:

Explanation

The reason why you would configure OSPF Open Shortest Path First (OSPF) is a link-state routing protocol that dynamically calculates the best routes for data transmission within an IP network. OSPF uses a hierarchical structure that divides a network into areas and assigns each router an identifier called router ID (RID). OSPF uses hello packets to discover neighbors and exchange routing information. OSPF uses Dijkstra's algorithm to compute the shortest path tree (SPT) based on link costs and build a routing table based on SPT. OSPF supports multiple equal-cost paths, load balancing, authentication, and various network types such as broadcast, point-to-point, point-to-multipoint, non-broadcast multi-access (NBMA), etc. OSPF is defined in RFC 2328 for IPv4 and RFC 5340 for IPv6. to use the IP address IP address Internet Protocol (IP) address is a numerical label assigned to each device connected to a computer network that uses the Internet Protocol for communication. An IP address serves two main functions: host or network interface identification and location addressing. There are two versions of IP addresses: IPv4 and IPv6. IPv4 addresses are 32 bits long and written in dotted-decimal notation, such as 192.168.1.1. IPv6 addresses are 128 bits long and written in hexadecimal notation, such as 2001:db8::1. IP addresses can be either static (fixed) or dynamic (assigned by a DHCP server). 10.1.200.1 as the router ID Router ID (RID) Router ID (RID) is a unique identifier assigned to each router in a routing

domain or protocol. RIDs are used by routing protocols such as OSPF, IS-IS, EIGRP, BGP, etc., to identify neighbors, exchange routing information, elect designated routers (DRs), etc.

RIDs are usually derived from one of the IP addresses configured on the router's interfaces or loopbacks, or manually specified by network administrators. RIDs must be unique within a routing domain or protocol instance. is that the loopback interface state Loopback interface is a virtual interface on a router that does not correspond to any physical port or connection. Loopback interfaces are used for various purposes such as testing network connectivity, providing stable router IDs for routing protocols, providing management access to routers, etc. Loopback interfaces have some advantages over physical interfaces such as being always up unless administratively shut down, being independent of any hardware failures or link failures, being able to assign any IP address regardless of subnetting constraints, etc. Loopback interfaces are usually numbered from zero (e.g., loopback0) upwards on routers. Loopback interfaces can also be created on PCs or servers for testing or configuration purposes using special IP addresses reserved for loopback testing (e.g., 127.x.x.x for IPv4 or ::1 for IPv6). Loopback interfaces are also known as virtual interfaces or dummy interfaces . Loopback interface state Loopback interface state refers to whether a loopback interface is up or down on a router . A loopback interface state can be either administratively controlled (by using commands such as no shutdown or shutdown) or automatically determined by routing protocols (by using commands such as passive-interface or ip ospf network point-to-point). A loopback interface state affects how routing protocols use the IP address assigned to the loopback interface for neighbor discovery , router ID selection , route advertisement , etc . A loopback interface state can also affect how other devices can access or ping the loopback interface . A loopback interface state can be checked by using commands such as show ip interfacebrief or show ip ospf neighbor . is independent of any physical interface and reduces routing updates.

The loopback interface state is independent of any physical interface because it does not depend on any hardware or link status. This means that the loopback interface state will always be up unless it is manually shut down by an administrator. This also means that the loopback interface state will not change due to any physical failures or link failures that may affect other interfaces on the router.

The loopback interface state reduces routing updates because it provides a stable router ID for OSPF that does not change due to any physical failures or link failures that may affect other interfaces on the router. This means that OSPF will not have to re-elect DRs Designated Routers (DRs) Designated Routers (DRs) are routers that are elected by OSPF routers in a broadcast or non-broadcast multi-access (NBMA) network to act as leaders and coordinators of OSPF operations in that network. DRs are responsible for generating link-state advertisements (LSAs) for the entire network segment, maintaining adjacencies with all other routers in the segment, and exchanging routing information with other DRs in different segments through backup designated routers (BDRs). DRs are elected based on their router priority values and router IDs . The highest priority router becomes the DR and the second highest priority router becomes the BDR . If there is a tie in priority values , then the highest router ID wins . DRs can be manually configured by setting the router priority value to 0 (which means ineligible) or 255 (which means always eligible) on specific interfaces . DRs can also be influenced by using commands such as ip ospf priority , ip ospf dr-delay , ip ospf network point-to-multipoint , etc . DRs can be verified by using commands such as show ip ospf neighbor , show ip ospf interface , show ip ospf database , etc . , recalculate SPT Shortest Path Tree (SPT) Shortest Path Tree (SPT) is a data structure that represents the shortest paths from a source node to all other nodes in a graph or network . SPT is used by link-state routing protocols such as OSPF and IS-IS to compute optimal routes based on link costs . SPT is built using Dijkstra's algorithm, which starts from the source node and iteratively adds nodes with the lowest cost paths to the tree until all nodes are included . SPT can be represented by a set of pointers from each node to its parent node in the tree , or by a set of next-hop addresses from each node to its destination node in the network . SPT can be updated by adding or removing nodes or links , or by changing link costs . SPT can be verified by using commands such as show ip route , show ip ospf database , show clns route , show clns database , etc . , or send LSAs Link-State Advertisements (LSAs) Link-State Advertisements (LSAs) are packets that contain information about the state and cost of links in a network segment . LSAs are generated and flooded by link-state routing protocols such as OSPF and IS-IS to exchange routing information with other routers in the same area or level . LSAs are used to build link-state databases (LSDBs) on each router , which store the complete topology of the network segment . LSAs are also used to compute shortest path trees (SPTs) on each router , which determine the optimal routes to all destinations in the network . LSAs have different types depending on their origin and scope , such as router LSAs , network LSAs , summary LSAs , external LSAs , etc . LSAs have different formats depending on their type and protocol version , but they usually contain fields such as LSA header , LSA type , LSA length , LSA age , LSA sequence number , LSA checksum , LSA body , etc . LSAs can be verified by using commands such as show ip ospf database , show clns database , debug ip ospf hello , debug clns hello , etc . due to changes in router IDs.

The other options are not reasons because:

The IP address associated with the loopback interface is non-routable and prevents loops: This option is false because the IP address associated with the loopback interface is routable and does not prevent loops. The IP address associated with the loopback interface can be any valid IP address that belongs to an existing subnet or a new subnet created specifically for loopbacks. The IP address associated with the loopback interface does not prevent loops because loops are caused by misconfigurations or failures in routing protocols or devices, not by IP addresses.

The loopback interface state is dependent on the management interface state and reduces routing updates: This option is false because the loopback interface state is independent of any physical interface state, including the management interface state Management interface Management interface is an interface on a device that provides access to management functions such as configuration, monitoring, troubleshooting, etc . Management interfaces can be physical ports such as console ports, Ethernet ports, USB ports, etc., or virtual ports such as Telnet sessions, SSH sessions, web sessions, etc . Management interfaces can use different protocols such as CLI Command-Line Interface (CLI) Command-Line Interface (CLI) is an interactive text-based user interface

that allows users to communicate with devices using commands typed on a keyboard . CLI is one of the methods for accessing management functions on devices such as routers, switches, firewalls, servers, etc . CLI can use different protocols such as console port serial communication protocol Serial communication protocol Serial communication protocol is a method of transmitting data between devices using serial ports and cables . Serial communication protocol uses binary signals that represent bits (0s and 1s) and sends them one after another over a single wire . Serial communication protocol has advantages such as simplicity, low cost, long

NEW QUESTION # 66

Which Aruba technology provides load balancing across radio bands and AP radios?

- A. Aruba AirWave
- B. Aruba Central
- C. Aruba ESP
- D. Aruba ClientMatch

Answer: D

Explanation:

Aruba ClientMatch is a technology that continuously monitors client behavior and automatically adjusts client connections to optimize Wi-Fi performance. This includes steering clients to the least congested access point and the best radio on the WLAN, which effectively provides load balancing across different radio bands and AP radios.

NEW QUESTION # 67

Please match the use case to the appropriate authentication technology

ClearPass Policy Manager		Add certificates to Android devices with the Aruba Onboard Application in the Google Play store that will be used for wireless authentication.
Cloud Authentication and Policy		Authenticate users on corporate-owned Chromebook devices using 802.1X and context gathered from the network devices that they log into.
		Leverage unbound Multi Pre-Shared Keys (MPSK) managed by Aruba Central to the end-users and client devices.
		Validate devices exist in a Mobile Device Management (MDM) database before authenticating BYOD users with corporate Active Directory using certificates

Answer:

Explanation:

	Answer Area	
ClearPass Policy Manager	Cloud Authentication and Policy	Add certificates to Android devices with the Aruba Onboard Application in the Google Play store that will be used for wireless authentication.
Cloud Authentication and Policy	ClearPass Policy Manager	Authenticate users on corporate-owned Chromebook devices using 802.1X and context gathered from the network devices that they log into.
	Cloud Authentication and Policy	Leverage unbound Multi Pre-Shared Keys (MPSK) managed by Aruba Central to the end-users and client devices.
	ClearPass Policy Manager	Validate devices exist in a Mobile Device Management (MDM) database before authenticating BYOD users with corporate Active Directory using certificates

Explanation:

Based on the information provided, here are the matches for the use case to the appropriate authentication technology:

ClearPass Policy Manager:

Authenticate users on corporate-owned Chromebook devices using 802.1X and context gathered from the network devices that they log into.

Validate devices exist in a Mobile Device Management (MDM) database before authenticating BYOD users with corporate Active Directory using certificates.

Cloud Authentication and Policy:

Add certificates to Android devices with the Aruba Onboard Application in the Google Play store that will be used for wireless authentication.

Leverage unbound Multi Pre-Shared Keys (MPSK) managed by Aruba Central to the end-users and client devices.

The ClearPass Policy Manager is a comprehensive network access control (NAC) and policy management platform that can authenticate devices using 802.1X, as well as integrate with MDM systems for device validation. The Cloud Authentication and Policy is likely referring to cloud-based services such as Aruba Central, which can manage MPSK and distribute certificates for device authentication.

NEW QUESTION # 68

DRAG DROP

Match the Open Systems Interconnection (OSI) layer with its comparable member of the TCP/IP stack.

(Options may be used more than once.)

	Answer Area	
TCP/IP Application		OSI Data Link
TCP/IP Network Interface		OSI Physical
		OSI Presentation
		OSI Session

Answer:

Explanation:

	Answer Area	
TCP/IP Application	TCP/IP Network Interface	OSI Data Link
TCP/IP Network Interface	TCP/IP Network Interface	OSI Physical
	TCP/IP Application	OSI Presentation
	TCP/IP Application	OSI Session

NEW QUESTION # 69

.....

This format is for candidates who do not have the time or energy to use a computer or laptop for preparation. HP HPE6-A85 PDF file includes real HP HPE6-A85 questions, and they can be easily printed and studied at any time. Itcerttest regularly updates its PDF file to ensure that its readers have access to the updated questions.
