HOT Certification Identity-and-Access-Management-Architect Sample Questions 100% Pass | Latest Salesforce Well Salesforce Certified Identity and Access Management Architect Prep Pass for sure

The TestPassKing is one of the leading platforms that have been offering valid, updated, and real Salesforce Identity-and-Access-Management-Architect exam dumps for many years. The Salesforce Certified Identity and Access Management Architect Identity-and-Access-Management-Architect practice test questions offered by the TestPassKing are designed and verified by experienced Salesforce Identity-and-Access-Management-Architect Certification Exam trainers. They work together and put all their expertise to ensure the top standard of Salesforce Certified Identity and Access Management Architect Identity-and-Access-Management-Architect valid dumps.

Salesforce Certified Identity and Access Management Architect Sample Questions (Q167-Q172):

NEW QUESTION # 167

When designing a multi-branded Customer Identity and Access Management solution on the Salesforce Platform, how should an identity architect ensure a specific brand experience in Salesforce is presented?

- A. Add a custom parameter to the service provider's OAuth/SAML call and implement logic on its login page to apply branding based on the parameters value.
- B. Provide a brand picker that the end user can use to select its sub-brand when they arrive on salesforce.
- C. The Audience ID, which can be set in a shared cookie.
- **D. The Experience ID, which can be included in OAuth/Open ID flows and Security Assertion Markup Language (SAML) flows as a URL parameter.**

Answer: D

Explanation:

Configuring an authentication provider to delegate authentication to the LDAP directory ensures that users can only log in to Salesforce if they are active in the LDAP directory. This prevents terminated employees from accessing Salesforce with their old credentials. References: Authentication Providers, Delegated Authentication Single Sign-On

NEW QUESTION # 168

A web service is developed that allows secure access to customer order status on the Salesforce Platform. The service connects to Salesforce through a connected app with the web server flow. The following are the required actions for the authorization flow:

1. User Authenticates and Authorizes Access
2. Request an Access Token
3. Salesforce Grants an Access Token
4. Request an Authorization Code
5. Salesforce Grants Authorization Code

What is the correct sequence for the authorization flow?

- **A. 4,5,2, 3, 1**
- B. 1, 4, 5, 2, 3
- C. 4, 1, 5, 2, 3
- D. 2, 1, 3, 4, 5

Answer: A

NEW QUESTION # 169

A technology enterprise is planning to implement single sign-on login for users. When users log in to the Salesforce User object custom field, data should be populated for new and existing users.

Which two steps should an identity architect recommend?

Choose 2 answers

- A. Implement SessionManagement Class.
- B. Implement RegistrationHandler Interface.
- **C. Create and update methods.**
- **D. Implement Auth.SamlJitHandler Interface.**

Answer: C,D

Explanation:

To populate data for new and existing users in the Salesforce User object custom field when they log in using SSO, the identity architect should implement the Auth.SamlJitHandler interface and create and update methods. The Auth.SamlJitHandler interface is an interface that defines how to handle SAML assertions for Just-in-Time (JIT) provisioning. JIT provisioning is a feature that allows Salesforce to create or update user records on the fly when users log in through an external identity provider. The create and update methods are methods in the Auth.SamlJitHandler interface that define how to create or update users in Salesforce based on the information from the SAML assertion. References: Auth.SamlJitHandler Interface, Just-in-Time Provisioning for SAML and OpenID Connect

NEW QUESTION # 170

Universal Containers(UC) has decided to build a new, highly sensitive application on Force.com platform. The security team at UC has decided that they want users to provide a fingerprint in addition to username/Password to authenticate to this application. How can an architect support fingerprint as a form of identification for Salesforce Authentication?

- A. Use an AppExchange product that does fingerprint scanning with native Salesforce identity confirmation.
- B. Use Delegated Authentication with callouts to a third-party fingerprint scanning application.
- C. Use Salesforce Two-factor Authentication with callouts to a third-party fingerprint scanning application.
- **D. Use custom login flows with callouts to a third-party fingerprint scanning application.**

Answer: D

Explanation:

D is correct because using custom login flows with callouts to a third-party fingerprint scanning application allows UC to support fingerprints as a form of identification for Salesforce authentication. Custom login flows allow UC to implement custom logic and UI elements for authentication, such as calling an external web service that performs fingerprint scanning and verification. A is incorrect because using Salesforce two-factor authentication with callouts to a third-party fingerprint scanning application does not support fingerprints as a form of identification for Salesforce authentication. Salesforce two-factor authentication requires users to enter a verification code or use an app like Salesforce Authenticator, not a fingerprint. B is incorrect because using delegated authentication with callouts to a third-party fingerprint scanning application does not support fingerprints as a form of identification for Salesforce authentication. Delegated authentication requires users to enter their username and password, not a fingerprint. C is incorrect because using an AppExchange product that does fingerprint scanning with native Salesforce identity confirmation does not support fingerprints as a form of identification for Salesforce authentication. AppExchange products are third-party applications that integrate with Salesforce, not native Salesforce features. Verified References: [Custom Login Flows], [Two-Factor Authentication], [Delegated Authentication], [AppExchange]

NEW QUESTION # 171

Northern Trail Outfitters manages application functional permissions centrally as Active Directory groups.

The CRM_SuperUser and CRM_Reporting_SuperUser groups should respectively give the user the SuperUser and Reporting_SuperUser permission set in Salesforce. Salesforce is the service provider to a Security Assertion Markup Language (SAML) identity provider.

How should an identity architect ensure the Active Directory groups are reflected correctly when a user accesses Salesforce?

- A. Use a login flow to query custom SAML attributes and set permission sets.
- B. Use a login flow to query standard SAML attributes and set permission sets.
- C. Use the Apex Just-in-Time handler to query standard SAML attributes and set permission sets.
- **D. Use the Apex Just-in-Time handler to query custom SAML attributes and set permission sets.**

Answer: D

Explanation:

Explanation

Using the Apex Just-in-Time handler to query custom SAML attributes and set permission sets is the best way to ensure that the Active Directory groups are reflected correctly when a user accesses Salesforce. The Apex Just-in-Time handler is a custom class that can process the SAML response from the identity provider and assign permission sets based on the user's AD groups. The other options are either not feasible or not effective for this use case. References: Just-in-Time Provisioning for SAML, Apex Just-in-Time Handler

NEW QUESTION # 172

.....

To some extent, to pass the Identity-and-Access-Management-Architect exam means that you can get a good job. The Identity-and-Access-Management-Architect exam materials you master will be applied to your job. The possibility to enter in big and famous companies is also raised because they need outstanding talents to serve for them. Our Identity-and-Access-Management-Architect Test Prep is compiled elaborately and will help the client a lot.
