

Important Tips to Pass CWNP CWAP-404 Exam Quickly

BTW, DOWNLOAD part of ExamcollectionPass CWAP-404 dumps from Cloud Storage: <https://drive.google.com/open?id=19Jn-JS8r6O0Ukic9E2AL-w6wFTh4-ews>

It is similar to the CWAP-404 desktop-based software, with all the elements of the desktop practice exam. This mock exam can be accessed from any browser and does not require installation. The Certified Wireless Analysis Professional (CWAP-404) questions in the mock test are the same as those in the real exam. And candidates will be able to take the web-based Certified Wireless Analysis Professional (CWAP-404) practice test immediately through any operating system and browsers.

CWNP CWAP-404 Exam Certification Details:

Sample Questions	CWNP CWAP-404 Sample Questions
Recommended Training	CWAP self-paced training kit, Training Class
Number of Questions	60
Exam Name	Wireless Analysis Professional
Exam Registration	PEARSON VUE

CWAP-404 Download Pdf | CWAP-404 Test Answers

The only aim of our company is to help each customer pass their exam as well as getting the important certification in a short time. If you want to pass your exam and get the CWAP-404 certification which is crucial for you successfully, I highly recommend that you should choose the CWAP-404 Study Materials from our company so that you can get a good understanding of the exam that you are going to prepare for.

CWNP Certified Wireless Analysis Professional Sample Questions (Q97-Q102):

NEW QUESTION # 97

After examining a Beacon frame decode you see the SSID Element has a length of 0. What do you conclude about this frame?

- A. SSID elements always have a length of 0
- B. This is a common attack on WISP backend SQL databases
- C. The frame is corrupted
- D. The beacon is from a BSS configured to hide the SSID

Answer: D

Explanation:

If the SSID element has a length of 0 in a Beacon frame decode, it means that the beacon is from a BSS configured to hide the SSID. The SSID element is a part of the Beacon frame that contains the name or identifier of the BSS. The SSID element has two fields: length and value. The length field indicates how many bytes are used for the value field, which contains the actual SSID string. If the length field is 0, it means that there is no value field or SSID string in the element. This is a common technique used by some APs to hide their SSID from passive scanning clients or potential attackers. However, this technique does not provide much security, as there are other ways to discover or reveal the hidden SSID, such as active scanning or capturing probe response or association frames.

NEW QUESTION # 98

According to 802.11-2007, in what frame type(s) might you find the PMK Count and PMKID List fields?

- **A. Only (Re)Association Request frames**
- B. Authentication and Association Request and Response frames
- C. EAPoL 4-Way Handshake frames
- D. All frames that include the RSN IE
- E. Beacon and Probe Response frames

Answer: A

NEW QUESTION # 99

What is indicated to a QoS AP when a QoS STA sets U-APSD Flag bits to 1 in (Re) Association frames?

- A. Which user priorities require use of a TSPEC
- B. Which access categories require admission control
- C. Which access categories are scheduled
- **D. Which access categories are both trigger-enabled and delivery-enabled**
- E. Which user priorities are mapped to access categories

Answer: D

NEW QUESTION # 100

What is encrypted within the third message of the 4-Way Handshake?

- A. PTK
- B. GMK
- C. PMK
- **D. GTK**

Answer: D

Explanation:

Explanation

The GTK (Group Temporal Key) is encrypted within the third message of the 4-Way Handshake. The 4-Way Handshake is a process that establishes a secure connection between a STA (station) and an AP (access point) using WPA2 (Wi-Fi Protected Access 2), which is a security protocol that uses AES-CCMP (Advanced Encryption Standard-Counter Mode CBC-MAC Protocol) as its encryption algorithm. The 4-Way Handshake consists of four messages that are exchanged between the STA and the AP. The first message is sent by the AP to the STA, containing the ANonce (Authenticator Nonce), which is a random number generated by the AP.

The second message is sent by the STA to the AP, containing the SNonce (Supplicant Nonce), which is a random number generated by the STA, and the MIC (Message Integrity Code), which is a value that verifies the integrity of the message. The third message is sent by the AP to the STA, containing the GTK, which is a key that is used to encrypt and decrypt multicast and broadcast data frames, and the MIC. The GTK is encrypted with the KEK (Key Encryption Key), which is derived from the PTK (Pairwise Temporal Key). The PTK is a key that is used to encrypt and decrypt unicast data frames, and it is derived from the PMK (Pairwise Master Key), the ANonce, and the SNonce. The fourth message is sent by the STA to the AP, containing only the MIC, to confirm the completion of the 4-Way Handshake. The other options are not correct, as they are not encrypted within the third message of the 4-Way Handshake. The PMK is a key that is derived from a passphrase or obtained from an authentication server, and it is not transmitted in any message of the 4-Way Handshake. The PTK is a key that is derived from the PMK, the ANonce,
