## CompTIA Cloud+ (2024) Sample Questions (Q246-Q251):

### NEW QUESTION # 246

A cloud engineer is troubleshooting an application that consumes multiple third-party REST APIs.

The application is randomly experiencing high latency. Which of the following would best help determine the source of the latency?

- A. Running a flow log on the network to analyze the packets
- **B. Enabling tracing to detect HTTP response times and codes**
- C. Configuring an API gateway to track all incoming requests
- D. Configuring centralized logging to analyze HTTP requests

**Answer: B**

Explanation:

Enabling tracing in the application can help determine the source of high latency by providing detailed information on HTTP request and response times, as well as response codes. This can identify which API calls are experiencing delays and contribute to overall application latency, allowing for targeted troubleshooting and optimization.

#### NEW QUESTION # 247

A cloud engineer is troubleshooting an application that consumes multiple third-party REST APIs. The application is randomly experiencing high latency. Which of the following would best help determine the source of the latency?

- A. Running a flow log on the network to analyze the packets
- **B. Enabling tracing to detect HTTP response times and codes**
- C. Configuring an API gateway to track all incoming requests
- D. Configuring centralized logging to analyze HTTP requests

**Answer: B**

Explanation:

Enabling tracing in the application can help determine the source of high latency by providing detailed information on HTTP request and response times, as well as response codes. This can identify which API calls are experiencing delays and contribute to overall application latency, allowing for targeted troubleshooting and optimization.

#### NEW QUESTION # 248

A technician needs to deploy two virtual machines in preparation for the configuration of a financial application next week. Which of the following cloud deployment models should the technician use?

- A. XaaS
- B. PaaS
- C. SaaS
- **D. IaaS**

**Answer: D**

Explanation:

IaaS, or Infrastructure as a Service, is a cloud computing model that provides virtual machines, storage, and networking resources. This allows the technician to deploy and configure the virtual machines that are needed for the financial application.

#### NEW QUESTION # 249

A cloud engineer is in charge of deploying a platform in an IaaS public cloud. The application tracks the state using session cookies, and there are no affinity restrictions. Which of the following will help the engineer reduce monthly expenses and allow the application to provide the service?

- **A. Pay-as-you-go model**
- B. Reserved resources
- C. Dedicated host
- D. Resource metering

**Answer: A**

Explanation:

A pay-as-you-go model would be beneficial for the cloud engineer because it allows the application to be scaled based on demand, reducing monthly expenses since costs are only incurred for the resources actually used. Since there are no affinity restrictions and the application uses session cookies for state tracking, the pay-as-you-go model can handle fluctuating workloads without the need to pay for unused reserved resources or dedicated hosts. #### NEW QUESTION # 250

A security engineer identifies a vulnerability in a containerized application. The vulnerability can be exploited by a privileged process to read the content of the host's memory. The security engineer reviews the following Dockerfile to determine a solution to mitigate similar exploits:

Which of the following is the best solution to prevent similar exploits by privileged processes?

- A. Changing FROM alpine3.17 to FROM alpine:latest
- **B. Adding the USER myappuser instruction**
- C. Patching the host running the Docker daemon
- D. Running the container with the readonly filesystem configuration

**Answer: B**

Explanation:

Adding the "USER myappuser" instruction to the Dockerfile is the best solution to prevent similar exploits by privileged processes. This instruction ensures that the container runs as a non-privileged user instead of the root user, significantly reducing the risk of privileged exploits.

Running containers with least privilege principles minimizes the potential impact of vulnerabilities, enhancing the overall security posture of the containerized environment.
