SPLK-1002 Reliable Braindumps Files & New SPLK-1002 Real Exam

As everybody knows, competitions appear ubiquitously in current society. In order to live a better live, people improve themselves by furthering their study, as well as increase their professional SPLK-1002 skills. Once you purchase our SPLK-1002 exam material, your time and energy will reach a maximum utilization. Thus at that time, you would not need to be afraid of the cruel society and peer pressure with SPLK-1002 Certification. In conclusion, a career enables you to live a fuller and safer life. So if you want to take an upper hand and get a well-pleasing career our SPLK-1002 learning question would be your best friend.

The SPLK-1002 certification exam is aimed at individuals who want to demonstrate their knowledge of the Splunk Core platform. SPLK-1002 exam covers a wide range of topics, including data input, searching and reporting, knowledge objects, and advanced data analysis. Individuals who pass the SPLK-1002 Exam will have demonstrated their ability to use Splunk effectively and efficiently, and will be recognized as experts in the field.

Splunk Core Certified Power User Exam Sample Questions (Q190-Q195):

NEW QUESTION # 190

Which of the following statements about calculated fields in Splunk is true?

- A. Calculated fields can be chained together to create more complex fields.
- B. Calculated fields cannot be chained together to create more complex fields.
- C. Calculated fields can only be used in dashboards.

- D. Calculated fields can only be used in saved reports.

Answer: A

Explanation:

The correct answer is B. Calculated fields can be chained together to create more complex fields.

Calculated fields are fields that are added to events at search time by using eval expressions. They can be used to perform calculations with the values of two or more fields already present in those events. Calculated fields can be defined with Splunk Web or in the props.conf file. They can be used in searches, reports, dashboards, and data models like any other extracted field.

Calculated fields can also be chained together to create more complex fields. This means that you can use a calculated field as an input for another calculated field. For example, if you have a calculated field named total that sums up the values of two fields named price and tax, you can use the total field to create another calculated field named discount that applies a percentage discount to the total field. To do this, you need to define the discount field with an eval expression that references the total field, such as:

```
discount = total * 0.9
```

This will create a new field named discount that is equal to 90% of the total field value for each event.

NEW QUESTION # 191

What is the correct way to name a macro with two arguments?

- A. us_sale,2
- B. us_sales(1,2)
- C. us_sales2
- **D. us_sales(2)**

Answer: D

NEW QUESTION # 192

After manually editing a regular expression (regex), which of the following statements is true?

- A. It is not possible to manually edit a regular expression (regex) that was created using the Field Extractor (FX) UI.
- **B. The Field Extractor (FX) UI keeps its own version of the field extraction in addition to the one that was manually edited.**
- C. Changes made manually can be reverted in the Field Extractor (FX) UI.
- D. It is no longer possible to edit the field extraction in the Field Extractor (FX) UI.

Answer: B

NEW QUESTION # 193

Which of the following statements describes the use of the Field Extractor (FX)?

- **A. Fields extracted using the Field Extractor do not persist and must be defined for each search.**
- B. The Field Extractor uses PERL to extract field from the raw events.
- C. Field extracted using the Field Extractor persist as knowledge objects.
- D. The Field Extractor automatically extracts all field at search time.

Answer: A

NEW QUESTION # 194

What is the correct syntax to find events associated with a tag?

- **A. tag:<field>=<value>**
- B. tags:<field>=<value>

- C. tag=<value>
- D. tags=<value>

Answer: A

Explanation:

Explanation

The correct syntax to find events associated with a tag is A. tag:<field>=<value>.

A tag is a way to add descriptive keywords to events based on field values. Tags can be used to filter and group events by common characteristics, such as source type, host, severity, or category1.

To search for events that have a specific tag, you need to use the tag field with the name of the field and the value of the tag as the arguments. The syntax for this is:

tag:<field>=<value>

For example, if you want to search for events that have the tag "error" for the status field, you can use the following syntax:

tag:status=error

This will return only the events that have the status field value tagged as "error".

The other options are not correct because they use different syntax or fields that are not related to tags. These options are:

B: tags=<value>: This option uses the tags field, which is a multivalue field that contains all the tags associated with an event.

However, this field is not searchable by default and requires additional configuration to enable it1.

C: tags:<field>=<value>: This option uses the tags field with a colon instead of an equal sign, which is not valid syntax for searching with fields.

D: tag=<value>: This option uses the tag field without specifying the name of the field, which is not valid syntax for searching with tags.
