CCAK Online Prüfung, CCAK Deutsche

Pass4Test ist eine spezielle Website, die Schulungsunterlagen zur ISACA CCAK Zertifizierungsprüfung bietet. Hier werden Ihre Fachkenntnisse nicht nur befördert werden. Und Sie können auch die Prüfung einmalig bestehen. Die Schulungsunterlagen von Pass4Test werden von den erfahrungsreichen Fachleuten nach ihren Erfahrungen und Kenntnissen bearbeitet. Sie sind von guter Qualität und extrem genau. Pass4Test wird Ihnen helfen, nicht nur die ISACA CCAK Zertifizierungsprüfung zu bestehen, sondern auch Ihre Fachkenntnisse zu konsolidieren. Außerdem genießen Sie einen einjährigen Update-Service.

ISACA Certificate of Cloud Auditing Knowledge CCAK Prüfungsfragen mit Lösungen (Q148-Q153):

148. Frage

Which of the following is the BEST way for a client to enforce a policy violation committed by a cloud service provider (CSP)?

- A. The violation is agreed upon and documented.
- B. Violations will be automatically enforced so no action is needed.
- C. The violation is agreed to verbally by the CSP.
- D. Nothing can be done to enforce violations as this is a cloud service.

Antwort: A

149. Frage

To ensure a cloud service provider is complying with an organization's privacy requirements, a cloud auditor should FIRST review:

- **A. organizational policies, standards, and procedures.**
- B. legal and regulatory requirements.
- C. adherence to organization policies, standards, and procedures.
- D. the IT infrastructure.

Antwort: A

Begründung:

To ensure a cloud service provider is complying with an organization's privacy requirements, a cloud auditor should first review the organizational policies, standards, and procedures that define the privacy objectives, expectations, and responsibilities of the organization. The organizational policies, standards, and procedures should also reflect the legal and regulatory requirements that apply to the organization and its cloud service provider, as well as the best practices and guidelines for cloud privacy. The organizational policies, standards, and procedures should provide the basis for evaluating the cloud service provider's privacy practices and controls, as well as the contractual terms and conditions that govern the cloud service agreement. The cloud auditor should compare the organizational policies, standards, and procedures with the cloud service provider's self-disclosure statements, third-party audit reports, certifications, attestations, or other evidence of compliance¹²³.

Reviewing the adherence to organization policies, standards, and procedures (B) is a subsequent step that the cloud auditor should perform after reviewing the organizational policies, standards, and procedures themselves. The cloud auditor should assess whether the cloud service provider is following the organization's policies, standards, and procedures consistently and effectively, as well as whether the organization is monitoring and enforcing the compliance of the cloud service provider. The cloud auditor should also identify any gaps or deviations between the organization's policies, standards, and procedures and the actual practices and controls of the cloud service provider¹²³.

Reviewing the legal and regulatory requirements is an important aspect of ensuring a cloud service provider is complying with an organization's privacy requirements, but it is not the first step that a cloud auditor should take. The legal and regulatory requirements may vary depending on the jurisdiction, industry, or sector of the organization and its cloud service provider. The legal and regulatory requirements may also change over time or be subject to interpretation or dispute. Therefore, the cloud auditor should first review the organizational policies, standards, and procedures that incorporate and translate the legal and regulatory requirements into specific and measurable privacy objectives, expectations, and responsibilities for both parties¹²³.

Reviewing the IT infrastructure (D) is not a relevant or sufficient step for ensuring a cloud service provider is complying with an organization's privacy requirements. The IT infrastructure refers to the hardware, software, network, and other components that support the delivery of cloud services. The IT infrastructure is only one aspect of cloud security and privacy, and it may not be accessible or visible to the cloud auditor or the organization. The cloud auditor should focus on reviewing the privacy practices and controls that are implemented by the cloud service provider at different layers of the cloud service model (IaaS, PaaS, SaaS), as well as the contractual terms and conditions that define the privacy rights and obligations of both parties¹²³.

150. Frage

APIs and web services require extensive hardening and must assume attacks from authenticated and unauthenticated adversaries.

- **A. True**
- B. False

Antwort: A

151. Frage

An organization that is utilizing a community cloud is contracting an auditor to conduct a review on behalf of the group of organizations within the cloud community. Of the following, to whom should the auditor report the findings?

- A. Public
- **B. Management of the organization being audited**
- C. Shareholders and interested parties
- D. Cloud service provider

Antwort: B

Begründung:

According to the ISACA CCAK Study Guide, the auditor should report the findings to the management of the organization being audited, as they are the primary stakeholders and decision makers for the cloud service.

The management is responsible for ensuring that the cloud service meets the requirements and expectations of the community, as well as complying with any relevant laws and regulations. The auditor should also communicate the findings to the cloud service provider, as they are the secondary stakeholders and service providers for the cloud service. The cloud service provider should be aware of any issues or gaps identified by the auditor and work with the management to resolve them. The auditor should not report the findings to the public, shareholders, or interested parties, as they are not directly involved in the cloud service or its governance. The auditor should respect the confidentiality and privacy of the community and its data, and only disclose the findings to those who have a legitimate need to know. References :=

152. Frage

Which of the following is a good candidate for continuous auditing?

- A. Procedures
- B. Documentation quality
- C. Governance
- **D. Cryptography and authentication**

Antwort: D

Begründung:

Cryptography and authentication are good candidates for continuous auditing, as they are critical aspects of cloud security that require constant monitoring and verification. Cryptography and authentication refer to the methods and techniques that ensure the confidentiality, integrity, and availability of data and communications in the cloud environment. Cryptography involves the use of encryption algorithms and keys to protect data from unauthorized access or modification. Authentication involves the use of credentials and tokens to verify the identity and access rights of users or devices. Continuous auditing can help to assess the effectiveness and compliance of cryptography and authentication controls, such as data encryption, key management, password policies, multifactor authentication, single sign-on, etc. Continuous auditing can also help to detect and alert any anomalies or issues that may compromise or affect cryptography and authentication, such as data breaches, key leakage, password cracking, unauthorized access, etc.¹²³.

Procedures (A) are not good candidates for continuous auditing, as they are not specific or measurable aspects of cloud security that can be easily automated or tested. Procedures refer to the steps or actions that are performed to achieve a certain objective or result in a specific domain or context. Procedures may vary depending on the type, nature, or complexity of the task or process involved. Continuous auditing requires a clear and consistent definition of the expected outcome or output, as well as the criteria or metrics to evaluate it. Procedures may not provide such a definition or criteria, and may require human judgment or interpretation to assess their effectiveness or compliance¹²³.

Governance (B) is not a good candidate for continuous auditing, as it is not a specific or measurable aspect of cloud security that can be easily automated or tested. Governance refers to the framework or system that defines the roles, responsibilities, policies, standards, procedures, and practices for managing and overseeing an organization or a domain. Governance may involve multiple stakeholders, such as management, board of directors, regulators, auditors, customers, etc., who have different interests, expectations, or perspectives. Continuous auditing requires a clear and consistent definition of the expected outcome or output, as well as the criteria or metrics to evaluate it. Governance may not provide such a definition or criteria, and may require human judgment or interpretation to assess its effectiveness or compliance¹²³.

Documentation quality (D) is not a good candidate for continuous auditing, as it is not a specific or measurable aspect of cloud security that can be easily automated or tested. Documentation quality refers to the degree to which the documents that describe or support an organization or a domain are accurate, complete, consistent, relevant, and understandable. Documentation quality may depend on various factors, such as the purpose, audience, format, style, language, structure, content, etc., of the documents involved. Continuous auditing requires a clear and consistent definition of the expected outcome or output, as well as the criteria or metrics to evaluate it. Documentation quality may not provide such a definition or criteria, and may require human judgment or interpretation to assess its effectiveness or compliance¹²³.
