2025 Associate CDPSE Level Exam 100% Pass | Pass-Sure Test CDPSE Dumps Free: Certified Data Privacy Solutions Engineer

Cracking the Certified Data Privacy Solutions Engineer (CDPSE) exam brings high-paying jobs, promotions, and validation of talent. Dozens of Certified Data Privacy Solutions Engineer (CDPSE) exam applicants don't get passing scores in the real CDPSE exam because of using invalid ISACA CDPSE exam dumps. Failure in the CDPSE Exam leads to a loss of time, money, and confidence. If you are an applicant for the Certified Data Privacy Solutions Engineer (CDPSE) exam, you can prevent these losses by using the latest real CDPSE exam questions of ValidTorrent.

The CDPSE Certification is ideal for individuals who are responsible for managing and protecting sensitive data within their organizations, including privacy officers, data protection officers, security professionals, and IT managers. Earning the CDPSE certification demonstrates a commitment to privacy and data protection, and provides individuals with the knowledge and skills needed to effectively manage privacy risks and compliance requirements in today's rapidly changing regulatory environment.

ISACA Certified Data Privacy Solutions Engineer Sample Questions (Q59-Q64):

NEW QUESTION # 59

Which of the following BEST illustrates privacy by design in the development of a consumer mobile application?

- A. The application only stores data locally.
- **B. The application requires consent before sharing locations.**
- C. The application shares personal information upon request.
- D. The application only stores data for 24 hours.

Answer: B

Explanation:

Privacy by design is an approach that embeds privacy principles and considerations into the design and development of products, services, systems, and processes that involve personal data. Privacy by design aims to protect the privacy and security of the data subjects, as well as to comply with the applicable privacy laws and regulations. One of the key principles of privacy by design is to obtain the consent and choice of the data subjects regarding the collection, use, and disclosure of their personal data. Therefore, the best example of privacy by design in the development of a consumer mobile application is to require consent before sharing locations, as this gives the data subjects control and transparency over their personal data. The other options are not as effective or sufficient as requiring consent before sharing locations, as they do not address the principle of consent and choice, or they may violate other privacy principles or requirements.

NEW QUESTION # 60

Which of the following MOST effectively protects against the use of a network sniffer?

- A. Network segmentation
- **B. Transport layer encryption**
- C. An intrusion detection system (IDS)
- D. A honeypot environment

Answer: B

Explanation:

Reference:

Transport layer encryption is the most effective way to protect against the use of a network sniffer, because it encrypts the data packets that are transmitted over a network, making them unreadable and useless for anyone who intercepts them. Transport layer encryption can be implemented using protocols such as Secure Sockets Layer (SSL), Transport Layer Security (TLS), or Secure Shell (SSH), which provide end-to-end encryption and authentication between the sender and the receiver of the data. By using transport layer encryption, the data can only be decrypted by the intended recipient, who has the proper key or certificate to do so. Therefore, even if a network sniffer captures the data packets, they cannot access or modify the sensitive information contained in them.

What is Packet Sniffing Attack in Network Sniffing?, EC-Council

Packet Sniffing Meaning, Methods, Examples and Best Practices, Spiceworks What is a packet sniffing attack? + how to prevent it, Norton

NEW QUESTION # 61

Which of the following is MOST important to establish within a data storage policy to protect data privacy?

- A. Collection limitation
- B. Data redaction
- C. Data quality assurance (QA)
- **D. Irreversible disposal**

Answer: D

Explanation:

Irreversible disposal is a process of removing or destroying data from a storage device or media to prevent unauthorized access or recovery of the data. Irreversible disposal is the most important thing to establish within a data storage policy to protect data privacy, as it reflects the principles of data minimization and storage limitation, which require limiting the collection, storage and processing of personal data to what is necessary and relevant for the intended purposes, and deleting or disposing of personal data when it is no longer needed or justified. Irreversible disposal also helps to reduce the privacy risks and costs associated with data storage and retention, such as data breaches, unauthorized access, misuse or loss of data. The other options are not as important as irreversible disposal in protecting data privacy within a data storage policy. Data redaction is a technique that removes or obscures sensitive or confidential information from a document or file, but it does not address the issue of data retention or deletion. Data quality assurance (QA) is a process of ensuring that the data meets the standards and specifications of accuracy, completeness, consistency and reliability, but it does not address the issue of data retention or deletion. Collection limitation is a principle that requires limiting the collection of personal data to what is necessary and relevant for the intended purposes, but it does not address the issue of data retention or deletion. NEW QUESTION # 62

Which of the following is the BEST way to ensure that application hardening is included throughout the software development life cycle (SDLC)?

- **A. Include qualified application security personnel as part of the process.**
- B. Require an annual third-party audit of new client software solutions.
- C. Require an annual internal audit of SDLC processes.
- D. Ensure comprehensive application security testing immediately prior to release.

Answer: A

Explanation:

The best way to ensure that application hardening is included throughout the software development life cycle (SDLC) is to include qualified application security personnel as part of the process. Application hardening is the process of applying security measures and techniques to an application to reduce its attack surface, vulnerabilities, and risks. Application hardening should be integrated into every stage of the SDLC, from planning and design to development and testing to deployment and maintenance. Including qualified application security personnel as part of the process helps to ensure that application hardening is performed effectively and consistently, as well as to provide guidance, feedback, and support to the developers, testers, and project managers. The other options are not as effective or sufficient as including qualified application security personnel as part of the process, as they do not address the root cause of the lack of application hardening, which is the gap in skills and knowledge among the SDLC participants.

NEW QUESTION # 63

Which of the following MUST be available to facilitate a robust data breach management response?

- A. An inventory of previously impacted individuals
- B. Best practices to obfuscate data for processing and storage
- **C. An inventory of affected individuals and systems**
- D. Lessons learned from prior data breach responses

Answer: C
