## ISACA Certificate of Cloud Auditing Knowledge Sample Questions (Q190-Q195):

### NEW QUESTION # 190

Why should the results of third-party audits and certification be relied on when analyzing and assessing the cybersecurity risks in the cloud?

- A. To contrast the risk generated by the loss of control
- B. To establish an audit mindset within the organization
- C. To establish an accountability culture within the organization
- D. To reinforce the role of the internal audit function

**Answer: A**

Explanation:

One possible reason why the results of third-party audits and certification should be relied on when analyzing and assessing the cybersecurity risks in the cloud is to contrast the risk generated by the loss of control. When an organization moves its data and processes to the cloud, it inevitably loses some degree of control over its security and compliance posture, as it depends on the cloud service provider (CSP) to implement and maintain adequate security measures and controls<sup>1</sup>. This loss of control can increase the organization's exposure to various cybersecurity risks, such as data breaches, unauthorized access, denial of service, malware infection, etc<sup>2</sup>. To mitigate these risks, the organization needs to have a clear understanding of the security and compliance level of the CSP, as well as the shared responsibility model that defines the roles and responsibilities of both parties<sup>3</sup>. Third-party audits and certification can provide some level of assurance that the CSP meets certain standards and requirements related to security and compliance, such as ISO/IEC 27001, CSA STAR, SOC 2, etc. These audits and certification can also help the organization compare and contrast the security posture of different CSPs in the market, as well as identify any gaps or weaknesses that need to be addressed or compensated.

Therefore, relying on the results of third-party audits and certification can help the organization contrast the risk generated by the loss of control in the cloud, and make informed decisions about selecting and managing its cloud services.

### NEW QUESTION # 191

Which of the following is a fundamental concept of FedRAMP that intends to save costs, time, and staff conducting superfluous agency security assessments?

- A. Use often, provide many times
- B. Do once, use many times
- C. Be economical, act deliberately
- D. Use existing, provide many times

**Answer: B**

### NEW QUESTION # 192

Which of the following is an example of integrity technical impact?

- A. The cloud provider reports a breach of customer personal data from an unsecured server.
- B. distributed denial of service (DDoS) attack renders the customer's cloud inaccessible for 24 hours.
- C. A hacker using a stolen administrator identity alters the discount percentage in the product database.
- D. An administrator inadvertently clicked on phishing bait, exposing the company to a ransomware attack.

**Answer: C**

Explanation:

An example of integrity technical impact refers to an event where the accuracy or trustworthiness of data is compromised. Option D, where a hacker uses a stolen administrator identity to alter the discount percentage in the product database, directly affects the integrity of the data. This action leads to unauthorized changes to data, which is a clear violation of data integrity. In contrast, options A, B, and C describe breaches of confidentiality, availability, and security, respectively, but do not directly impact the integrity of the data itself<sup>123</sup>.

References = The concept of data integrity in cloud computing is extensively covered in the literature, including the importance of protecting against unauthorized data alteration to maintain the trustworthiness and accuracy of data throughout its lifecycle<sup>123</sup>.

### NEW QUESTION # 193

The CSA STAR Certification is based on criteria outlined the Cloud Security Alliance (CSA) Cloud Controls Matrix (CCM) in addition to:

- A. GDPR CoC certification.
- B. SOC 2 Type 1 or 2 reports.
- C. ISO/IEC 27001 implementation.
- D. GB/T 22080-2008.

**Answer: C**

Explanation:

The CSA STAR Certification is based on criteria outlined in the Cloud Security Alliance (CSA) Cloud Controls Matrix (CCM) in addition to ISO/IEC 27001 implementation. ISO/IEC 27001 is an international standard that specifies the requirements for establishing, implementing, maintaining and continually improving an information security management system (ISMS). The CSA STAR Certification is a third-party independent assessment of the security of a cloud service provider, which demonstrates the alignment of the provider's ISMS with the CCM best practices. The CSA STAR Certification has three levels: Level 1 (STAR Certification), Level 2 (STAR Attestation), and Level 3 (STAR Continuous Monitoring).<sup>1</sup> [2][2] References := CCAK Study Guide, Chapter 5: Cloud Auditing, page 971; CSA STAR Certification, Overview<sup>2</sup>[2]

### NEW QUESTION # 194

What is resource pooling?

- A. None of the above.
- B. Placing Internet ("cloud") data centers near multiple sources of energy, such as hydroelectric dams.
- C. The provider's computing resources are pooled to serve multiple consumers.
- D. Internet-based CPUs are pooled to enable multi-threading.
- E. The dedicated computing resources of each client are pooled together in a colocation facility.

**Answer: C**
