ISTQB-CTAL-TA Reliable Exam Pdf | Exam ISTQB-CTAL-TA Success

Three versions for ISTQB-CTAL-TA exam cram are available, and you can choose the most suitable one according to your own needs. ISTQB-CTAL-TA Online test engine supports all web browsers, and you can also have offline practice. One of the most outstanding features of ISTQB-CTAL-TA Online test engine is that it has testing history and performance review, and you can have

a general review of what you have learnt through this version. ISTQB-CTAL-TA Soft test engine supports MS operating system as well as stimulates real exam environment, therefore it can build up your confidence. ISTQB-CTAL-TA PDF version is printable, and you can study anytime.

ISTQB (ISTQB CTAL-TA) ISTQB Certified Tester Advanced Level - Test Analyst (Syllabus 2012) Sample Questions (Q55-Q60):

NEW QUESTION # 55

Which of the following statements BEST describes checklist-based and black-box test techniques?

SELECT ONE OPTION

- A. Checklist-based testing derives tests from lists which focus on defects; black-box techniques find defects through systematic test case design
- B. Checklists should only be used as a source of test design for inexperienced testers; requirement specifications are often used as the basis for applying black-box techniques
- **C. The checklist-based technique is most effective when applied by experienced testers; black-box techniques are most effective applied against a well-specified test basis**
- D. The checklist-based technique produces consistent, reproducible test cases; test cases produced by black-box techniques are less systematic

Answer: C

Explanation:

Comprehensive and Detailed in Depth Explanation:

* A. Correct because checklist-based testing relies on the experience of testers to be effective, while black-box techniques are more efficient when the test basis (like requirements) is well defined.

* B. Incorrect because checklist-based testing does not necessarily focus on defects.

* C. Incorrect because checklists are not limited to inexperienced testers.

* D. Incorrect because black-box techniques are designed to be systematic and structured.

Therefore, the correct answer is A (The checklist-based technique is most effective when applied by experienced testers; black-box techniques are most effective applied against a well-specified test basis).

NEW QUESTION # 56

A web-based system is being developed to support the administration of tennis tournaments.

The system provides advice on how much money to offer each player as their individual attendance fee. The amount depends on a combination of the following factors:

* Overall attendance fund (divided into five numeric ranges)

* Player's current world ranking (divided into ten numeric ranges)

* Whether it is a local tournament for the player (YES or NO)

* Their relationship with the tournament sponsors (clothing, equipment, or endorsement)

* Their previous attendance history at this event (finalist, played, withdrew before event, or withdrew during event) The new system needs to be ready for the next tournament in just a few months' time, so testing schedules will be severely challenged.

Which specification-based technique would be the BEST choice in the circumstances?

SELECT ONE OPTION:

- A. Use case testing
- B. State Transition testing
- C. Equivalence partitioning
- **D. Pairwise testing**

Answer: D

Explanation:

Comprehensive and Detailed In-Depth Explanation:

* A (Use case testing): Not suitable as it focuses on user interactions rather than combinations of input values.

* B (State Transition testing): Irrelevant since the focus is not on state changes.

* C (Equivalence partitioning): Good for partitioning input values but not efficient for combinations.

* D (Pairwise testing): Correct. This technique is highly efficient for covering combinations of multiple variables with fewer test cases, which is crucial when the schedule is tight.

Therefore, the correct answer is D (Pairwise testing).

NEW QUESTION # 57

A web-based system is being developed to support the administration of tennis tournaments.

The system provides advice on how much money to offer each player as their individual attendance fee.

The amount depends on a combination of the following factors:

- * Overall attendance fund (divided into five numeric ranges)
 - * Player's current world ranking (divided into ten numeric ranges)
 - * Whether it is a local tournament for the player (YES or NO)
 - * Their relationship with the tournament sponsors (clothing, equipment, or endorsement)
 - * Their previous attendance history at this event (finalist, played, withdrew before event, or withdrew during event)
- It has been noted that the attendance fee calculation does not take account of 'last minute' invitations that are made to replace a player who withdraws close to the tournament start date. In this case, enhanced attendance fees are offered depending on whether the invitation is made within a week, a fortnight, or a month of the tournament start date.

Which of the following specification-based techniques would be the BEST choice for testing the 'last minute' scenario where players are replaced close to the tournament start, and what type of defect is being targeted by the testing?

SELECT ONE OPTION:

- A. Boundary Value Analysis technique; Date comparison defects
- **B. Decision Table testing technique; Fee calculation defects**
- C. Use Case testing technique; Fee specification defects
- D. Equivalence Partitioning technique; Date formatting defects

Answer: B

Explanation:

Comprehensive and Detailed In-Depth Explanation:

- * A (Decision Table testing technique): Correct. Decision tables are ideal for handling complex combinations and business rules, such as calculating fees based on various factors. The defect here is related to fee calculation logic.
 - * B (Use Case testing): Incorrect. Use cases are better for user interaction scenarios.
 - * C (Equivalence Partitioning): Incorrect. Date formatting is not the issue here.
 - * D (Boundary Value Analysis): Incorrect. The problem is not with date comparison, but with rule- based fee calculation.
- Therefore, the correct answer is A (Decision Table testing technique; Fee calculation defects).

NEW QUESTION # 58

When applying for health insurance from Health4You, applicants are categorized according to their age, sex, the number of units of alcohol they consume in an average week, Body Mass Index (BMI), whether in full-time work, and whether a smoker.

Insurance is offered, and the premium is calculated according to the following rules:

- * Insurance cover is NOT given to those aged 70 or more, or below 18
 - * Those who consume more than 14 units of alcohol a week have an additional premium of £25 per month
 - * Those with a BMI greater than 35 are NOT given insurance cover
 - * Smokers have an additional premium of £20 per month
 - * Those in full-time employment have a premium reduction of £20 per month
- How many test cases are required to give full coverage for the above rules when using a decision table that excludes rules containing infeasible combinations of condition values?

SELECT ONE OPTION:

- A. 0
- **B. 1**
- C. 2
- D. 3

Answer: B

Explanation:

Comprehensive and Detailed In-Depth Explanation:

- * Conditions:
- * Age (3): Below 18, 18-69, 70+
- * Alcohol Consumption (2): #14 units, >14 units
- * BMI (2): #35, >35
- * Smoking (2): Yes, No
- * Employment (2): Full-time, Not full-time

* Feasibility Check:
 * Age < 18 and Age # 70: Not covered (2 invalid cases)
 * BMI > 35: Not covered (1 invalid case)
 Valid combinations: $3 \times 2 \times 2 \times 2 \times 2 = 96$
 Therefore, the correct answer is B (96).

NEW QUESTION # 59

For the use case Copy A4 to A4 for a new copier, the following scenarios were identified.

Basic scenario single-sided to single-sided.

Alternatives single-sided to double-sided, copy of a set, copy using the automatic document feeder
 Errors: no paper in paper tray, paper jam, out of staples.

What is the minimum number of test cases needed to achieve the minimum acceptable level of coverage for this use case?

- A. 0
- B. 1
- C. 2
- D. 3

Answer: A

Explanation:

Seven test cases are needed to achieve the minimum acceptable level of coverage for this use case. A use case is a technique that describes the interactions between a system and its actors to achieve a specific goal. A use case consists of a basic scenario and alternative scenarios that describe the normal and exceptional flows of events. The minimum acceptable level of coverage for a use case is achieved when at least one test case covers each scenario and each error condition. The scenarios and error conditions for this use case are:

- * Basic scenario: single-sided to single-sided
- * Alternatives: single-sided to double-sided, copy of a set, copy using the automatic document feeder
- * Errors: no paper in paper tray, paper jam, out of staples

The number of test cases is equal to the number of scenarios and error conditions, which is 7. Verified References: [ISTQB Certified Tester Advanced Level Test Analyst CTAL-TA], Section 3.6.1, page 43.

NEW QUESTION # 60

.....

The PDF version of our ISTQB-CTAL-TA study tool is very practical, which is mainly reflected on the special function. As I mentioned above, our company are willing to provide all people with the demo for free. You must want to know how to get the trial demo of our ISTQB-CTAL-TA question torrent; the answer is the PDF version. You can download the free demo form the PDF version of our ISTQB-CTAL-TA exam torrent. Maybe you think it does not prove the practicality of the PDF version, do not worry, we are going to tell us another special function about the PDF version of our ISTQB-CTAL-TA Study Tool. If you download our study materials successfully, you can print our study materials on pages by the PDF version of our ISTQB-CTAL-TA exam torrent. We believe these special functions of the PDF version will be very useful for you to prepare for your exam. We hope that you will like the PDF version of our ISTQB-CTAL-TA question torrent.
