ISTQB Certified Tester Foundation Level (CTFL v4.0) Sample Questions (Q351-Q356):

NEW QUESTION # 351

You are an experienced tester on a project with incomplete requirements and under pressure to deploy. What type of testing should you do?

- A. Decision-based testing
- **B. Exploratory testing**
- C. Checklist-based testing
- D. Error guessing

Answer: B

Explanation:

When working on a project with incomplete requirements and under pressure to deploy, exploratory testing is particularly suitable. This type of testing allows testers to use their expertise and intuition to explore the system's functionality and identify defects without needing detailed specifications. Exploratory testing is flexible and can quickly adapt to changes and gaps in the requirements.

NEW QUESTION # 352

Which of the following is an example of black-box dynamic testing?

- A. Functional Testing
- B. Coverage analysis
- C. Checking memory leaks for a program by executing it
- D. Code inspection

Answer: A

Explanation:

Functional testing is an example of black-box dynamic testing. Black-box testing (also known as specification-based testing) is a type of testing that does not consider the internal structure or implementation of the system under test, but rather its external behavior or functionality. Dynamic testing is a type of testing that involves executing the system under test with various inputs and observing its outputs. Functional testing is a type of black-box dynamic testing that verifies that the system under test performs its intended functions according to its requirements or specifications. Functional testing can be performed at various levels and scopes depending on the objectives and criteria of testing. The other options are not examples of black-box dynamic testing. Code inspection is an example of white-box static testing. White-box testing (also known as structure-based testing) is a type of testing that considers the internal structure or implementation of the system under test. Static testing is a type of testing that does not involve executing the system under test, but rather analyzing it for defects, errors, or violations of standards. Code inspection is a type of white-box static testing that involves examining the source code of the system under test for quality, readability, maintainability, etc.

Checking memory leaks for a program by executing it is an example of white-box dynamic testing. Memory leaks are defects that occur when a program fails to release memory that it has allocated but no longer needs.

Checking memory leaks for a program by executing it requires knowledge and access to the internal structure or implementation of the program, such as memory allocation and deallocation mechanisms, pointers, references, etc. Coverage analysis is an example of white-box static testing. Coverage analysis is a technique that measures how much of the code or structure of the system under test has been exercised by a test suite.

Coverage analysis requires knowledge and access to the internal structure or implementation of the system under test, such as statements, branches, paths, conditions, etc. Verified References: A Study Guide to the ISTQB Foundation Level 2018 Syllabus - Springer, page 7.

NEW QUESTION # 353

Which of the following statements is true?

Select exactly one option (1 out of 4)!

- A. Any deviation of the actual from the expected result represents an error.
- B. Errors are the inevitable result of software failure.
- C. Defects in the program code may be caused by environmental conditions.
- D. Defects in the program code may result in failures in the program during execution.

Answer: D

NEW QUESTION # 354

Which of the following statements is true?

- A. In Agile software development, work product documentation tends to be lightweight and manual tests tend to be often unscripted as they are often produced using experience-based test techniques
- B. Sequential development models impose the use of systematic test techniques and do not allow the use of experience-based test techniques
- C. Both in Agile software development and in sequential development models, such as the V-model, test levels tend to overlap since they do not usually have defined entry and exit criteria
- D. In Agile software development, the first iterations are exclusively dedicated to testing activities, as testing will be used to drive development, which will be performed in the subsequent iterations

Answer: A

Explanation:

This answer is correct because in Agile software development, work product documentation, such as user stories, acceptance criteria, or test cases, tends to be lightweight and concise, as the focus is on working software and frequent communication rather than comprehensive documentation. Manual tests tend to be often unscripted, as they are often produced using experience-based test techniques, such as error guessing or exploratory testing, which rely on the tester's skills, knowledge, and creativity to find defects and provide feedback. NEW QUESTION # 355

Which of the following statements best describes the way in which decision coverage is measured?

- A. Measured as the number of statements executed by the tests, divided by the total number of executable statements in the code.
- **B. Measured as the number of decision outcomes executed by the tests, divided by the total number of decision outcomes in the test object.**
- C. It is not possible to accurately measure decision coverage.
- D. Measured as the number of lines of code executed by the tests, divided by the total number of lines of code in the test object.

Answer: B

Explanation:

Decision coverage, also known as branch coverage, is measured as the number of decision outcomes executed by the tests divided by the total number of decision outcomes in the test object. It ensures that every possible branch (true/false) decision in the code has been executed at least once.
