ISTQB (ISTQB CTAL-TA) ISTQB Certified Tester Advanced Level - Test Analyst (Syllabus 2012) Sample Questions (Q64-Q69):

NEW QUESTION # 64

Which pair of statements correctly describes when functional completeness, functional correctness, and/or functional appropriateness are undertaken?

SELECT ONE OPTION

- A. Functional completeness is performed as the last stage of testing; Functional correctness can be undertaken at any test level and often uses the specification or legacy system as a test oracle
- B. Functional correctness testing is only performed at the system test level; functional completeness is performed at the system integration testing stage
- C. Functional completeness for system integration may focus on high-level business cases; functional appropriateness is usually performed prior to system testing
- **D. Functional appropriateness testing is usually undertaken during system testing (but also during the later stages of integration testing); functional correctness testing can be conducted at any test level**

Answer: D

Explanation:

Comprehensive and Detailed in Depth Explanation:

* Functional appropriateness testing is often done during system testing because it evaluates whether the implemented functions meet user needs, but it can also be part of integration testing when assessing integrated components.

* Functional correctness testing is not limited to any specific test level. It can be performed during unit, integration, system, or acceptance testing to verify the accuracy of functions.

* Option B is incorrect because functional completeness is not necessarily the last stage of testing.

* Option C is incorrect because functional appropriateness is mainly done during system testing, not before.

* Option D is incorrect because functional correctness is not restricted to system testing.

The correct answer is A (Functional appropriateness testing is usually undertaken during system testing; functional correctness testing can be conducted at any test level).

NEW QUESTION # 65

Which of the following statements about defect-based techniques is TRUE?

SELECT ONE OPTION

- A. Defect-based testing is a technique that identifies defects in requirements early in the lifecycle
- **B. In defect-based testing, the type of defect sought is used as the basis for test design**
- C. The coverage criteria for black-box test techniques tend to be less systematic than for defect-based test techniques
- D. Defect-based techniques are mainly used by developers at the component test level

Answer: B

Explanation:

Comprehensive and Detailed in Depth Explanation:

* Defect-based techniques use the knowledge of defects that have occurred in the past to develop test cases that target similar types of issues.

* Option C correctly states that defect-based testing focuses on using known defect types as the basis for designing tests.

* Option A is incorrect because defect-based testing can be applied at various levels, not just the component level.

* Option B is incorrect since defect-based techniques do not necessarily guarantee more systematic coverage than black-box techniques.

* Option D is incorrect because defect-based testing focuses on detecting specific defect types rather than verifying requirements early.

Hence, the correct answer is C (In defect-based testing, the type of defect sought is used as the basis for test design).

NEW QUESTION # 66

A tablet manufacturer offers the following options for its customers:

* Colour: Black, White, Silver, Gold

* Model: Standard, Mini, Pro

* Gigabytes:32, 64, 128, 256

* Connectivity:Wifi-only, Wifi+Cellular

When applying the pairwise test technique, how many TEST CASES would be needed to ensure that ALL pair combinations are tested?

SELECT ONE OPTION

- A. 0
- B. 1
- C. 2
- D. 3

Answer: A

Explanation:

Comprehensive and Detailed in Depth Explanation:

Pairwise testing is a combinatorial test design technique in which test cases are designed to execute all possible discrete combinations of each pair of input parameters. This technique significantly reduces the number of test cases compared to exhaustive testing while still covering pairwise interactions.

To calculate the number of test cases:

* Colour: 4 options

* Model: 3 options

* Gigabytes: 4 options

* Connectivity: 2 options

Pairwise testing does not necessarily involve multiplying all options, as it aims to cover all pairs. Using an orthogonal array or pairwise tool, the minimum number of test cases that cover all pairs for these parameters is

16. Hence, the answer isC (16).

NEW QUESTION # 67

A PIN entry component of an ATM system has been developed using the following state table:

	Insert Card	Enter Pin	Valid Pin	Invalid Pin
S1) Start State	S2	-	-	-
S2) Wait for PIN	-	S3	-	-
S3) 1st try	-	-	S6	S4
S4) 2nd try	-	-	S6	S5
S5) 3rd try	-	-	S6	S7
S6) Access account	-	-	-	-
S7) Eat card	-	-	-	-

Using the state transition test technique, how many 0-switch test cases are needed to achieve 100% 0-switch coverage?

- A. 0
- B. 1
- C. 2
- D. 3

Answer: A

Explanation:

Eight 0-switch test cases are needed to achieve 100% 0-switch coverage. A state transition test technique is a technique that tests the behavior of a system or component based on its states and transitions between them. A

0-switch test case is a test case that covers one state and its associated actions and events. To achieve 100% 0- switch coverage, all states and their associated actions and events must be covered by at least one test case.

The states for this scenario are:

* Enter PIN

* PIN OK

- * PIN not OK
- * 1st try
- * 2nd try
- * 3rd try
- * Access to act
- * Eat card

NEW QUESTION # 68

A major software upgrade includes many new facilities and presents very different screens based on user roles. Computational accuracy is the greatest business risk. Which quality characteristic would you focus on the MOST when testing the system?
SELECT ONE OPTION

- A. Installability
- **B. Functional correctness**
- C. Functional completeness
- D. Functional appropriateness

Answer: B

Explanation:

Comprehensive and Detailed in Depth Explanation:

- * Functional correctness ensures that the software performs its intended functions accurately and without errors.
 - * Since computational accuracy is the main risk, testing must focus on verifying that calculations and data processing are performed correctly.
 - * Functional completeness (A) focuses on whether all required functions are implemented.
 - * Functional appropriateness (C) checks whether the functions meet user needs.
 - * Installability (D) concerns the ease of installing the system, not accuracy.
- Therefore, the correct answer is B (Functional correctness).
