This ITIL 4 Practitioner: Release Management Exam (ITIL-4-Practitioner-Release-Management) software has a simple-to-use interface. By using the ITIL 4 Practitioner: Release Management Exam (ITIL-4-Practitioner-Release-Management) practice exam software, you can evaluate your mistakes at the end of every take and overcome them. Our software

helps you to get familiar with the format of the original ITIL 4 Practitioner: Release Management Exam (ITIL-4-Practitioner-Release-Management) test.

Peoplecert ITIL 4 Practitioner: Release Management Exam Sample Questions (Q21-Q26):

NEW QUESTION # 21

A service owner is initiating the release planning and coordination process for a complex project. What is an example of the FIRST activity that the service owner should undertake in this instance?

- A. Test the service components and take remedial action as necessary
- B. Check that an automated notification has been sent to stakeholders
- C. Select a release model that fits with the types of changes to be included in the release
- D. Ensure that the release procedures are appropriate for the particular release under consideration

Answer: C

Explanation:

The release planning and coordination process begins with defining the approach for the release. The ITIL 4 Practitioner: Release Management document states: "The first step in release planning and coordination is to select an appropriate release model that fits the types of changes to be included in the release. This ensures that the release approach aligns with the nature and complexity of the changes" (Section 3.2.1).

* Option A (Test the service components) is part of the release execution or testing phase, not the first step in planning.

* Option B (Ensure that the release procedures are appropriate) is a subsequent step after selecting the model, to confirm procedural alignment.

* Option C (Select a release model) is the first activity, as it sets the foundation for how the release will be structured and managed, especially for a complex project.

* Option D (Check that an automated notification has been sent) occurs later, during the communication phase of the release process.

The correct answer is C, as selecting the release model is the initial step in release planning.

NEW QUESTION # 22

During a value stream walk of the incident resolution value stream, an organization has realized that some incidents take longer to resolve because installation of overdue software updates is required. What should the organization do to improve the incident resolution times?

- A. Ensure that required updates are included in the release of the new services
- B. Ensure that required updates are enforced as part of the ongoing operations and maintenance
- C. Include release of the required updates in the incident resolution activities
- D. Include release of the required updates in the request fulfilment activities

Answer: B

Explanation:

This scenario involves using technology to improve incident resolution by addressing overdue updates. The ITIL 4 Practitioner: Release Management document states: "To prevent delays in incident resolution due to overdue updates, release management can enforce updates as part of ongoing operations and maintenance, using automated tools to ensure systems are up-to-date" (Section 4.2).

* Option A (Include updates in incident resolution activities) is reactive and inefficient, as it delays resolution by embedding release activities into incident handling.

* Option B (Ensure updates are enforced as part of ongoing operations and maintenance) is proactive, using technology to keep systems updated, thus reducing incident resolution times by preventing the issue.

* Option C (Include updates in request fulfilment activities) addresses user requests, not the root cause of incident delays.

* Option D (Ensure updates are included in the release of new services) doesn't address existing systems needing updates, only new services.

The correct answer is B, as it leverages technology in operations to proactively manage updates, aligning with ITIL 4 principles.

NEW QUESTION # 23

An organization invested in the development and adoption of a common approach to release management. Which metric will help the organization to understand if this initiative has been successful?

- A. Alignment of release management procedures between the organization and its suppliers
- B. The number of releases that were implemented after the target implementation date
- **C. The percentage of releases that do not result in incidents**
- D. The satisfaction rating given by service consumers of individual releases

Answer: C

Explanation:

A common approach to release management aims to improve the reliability and stability of releases. The ITIL 4 Practitioner: Release Management document highlights key metrics for evaluating the success of release management: "Key metrics for release management often include the percentage of releases that do not result in incidents, as this indicates the stability and reliability of the release process" (Section 5.3).

* Option A (Alignment with suppliers) is a process improvement metric but doesn't directly measure the success of the release outcomes.

* Option B (The percentage of releases that do not result in incidents) directly measures the effectiveness of the release process by assessing its impact on service stability, aligning with the goal of a common approach to reduce errors and disruptions.

* Option C (Satisfaction rating) is a valuable metric but is more subjective and less directly tied to the operational success of a common approach.

* Option D (Number of delayed releases) measures timeliness but not the quality or stability of the releases.

The best metric to assess the success of a standardized release management approach is the reduction in incidents, making B the correct answer.

NEW QUESTION # 24

What is a description of a release?

- **A. A set of new service features that will benefit users**
- B. The guidelines for collating two or more changes
- C. The repeated building and testing of code leading to deployment
- D. All updated service versions that are mandatory for users

Answer: A

Explanation:

In ITIL 4, a release is defined as the output of the release management practice that is made available to users.

The ITIL 4 Practitioner: Release Management document states: "A release is a version of a service or a set of service components that is made available for use. It often includes new or changed features that deliver value to users" (Section 2.2).

* Option A (A set of new service features that will benefit users) aligns with the definition, as a release typically includes new or changed features intended to provide value to users.

* Option B (The repeated building and testing of code) describes a development process (e.g., continuous integration), not the release itself.

* Option C (All updated service versions that are mandatory for users) is incorrect because releases are not always mandatory; ITIL 4 allows for push or pull approaches.

* Option D (Guidelines for collating changes) describes a process or policy, not the release itself.

The correct description of a release is a set of features or components made available for use, making A the correct answer.

NEW QUESTION # 25

An organization manually checks that releases of new or changed products/services have been successfully completed. Which tools should be used to automate this process?

- A. Workflow management and collaboration tools
- **B. Monitoring and event management tools**
- C. Enterprise architecture tools
- D. Analysis and reporting tools

Answer: B

Explanation:

Automating the verification of release success involves tracking the performance and stability of the released services. The ITIL 4 Practitioner: Release Management document notes: "Monitoring and event management tools can automate the verification of release success by tracking system performance and detecting anomalies post-release, ensuring the release meets its objectives" (Section 4.2).

* Option A (Monitoring and event management tools) is correct, as these tools can automatically check system health and performance after a release, replacing manual checks.

* Option B (Workflow management and collaboration tools) focuses on process coordination, not post-release verification.

* Option C (Enterprise architecture tools) is used for dependency mapping, not release verification.

* Option D (Analysis and reporting tools) provides retrospective insights but doesn't automate real-time verification.

The correct answer is A, as monitoring tools are best suited for automating release verification.

NEW QUESTION # 26

.....

Itcertkey help you to find real Peoplecert ITIL-4-Practitioner-Release-Management exam preparation process in a real environment. If you are a beginner, and if you want to improve your professional skills, Itcertkey Peoplecert ITIL-4-Practitioner-Release-Management exam braindumps will help you to achieve your desire step by step.
