Valid Juniper JN0-253 Test Pattern & JN0-253 Downloadable PDF

Our JN0-253 study prep has inspired millions of exam candidates to pursuit their dreams and motivated them to learn more high-efficiently. Many customers get manifest improvement. JN0-253 simulating exam will inspire your potential. And you will be more successful with the help of our JN0-253 training guide. Just imagine that when you have the certification, you will have a lot of opportunities to come to the bigger companies and get a higher salary.

Juniper Mist AI, Associate (JNCIA-MistAI) Sample Questions (Q58-Q63):

NEW QUESTION # 58

In Juniper Mist, which three devices send data to the Juniper Mist Cloud? (Choose three.)

- A. Syslog Server
- B. Juniper Mist Edge
- C. RADIUS Server
- D. Access Point
- E. Session Smart Router

Answer: B,D,E

Explanation:

In the Juniper Mist Cloud architecture, data is collected and streamed from various edge devices to the Mist Cloud platform, where AI-driven analytics, automation, and telemetry correlation occur. Only Mist-managed devices that are cloud-connected contribute operational telemetry data to Mist AI for analysis.

According to the Juniper Mist Cloud Architecture and Operations Guide:

"Access Points, Juniper Mist Edge devices, and Session Smart Routers (SSR) communicate directly with the Mist Cloud, sending telemetry, configuration, and analytics data in real time."

- * Access Points (B): Provide wireless client telemetry, RF statistics, and user SLE (Service Level Expectation) data.

- * Session Smart Routers (C): Supply WAN Assurance and routing analytics, including path and session health data.

- * Juniper Mist Edge (D): Acts as an on-premises gateway that forwards data and enables local breakout for Mist Cloud services. Syslog Servers and RADIUS Servers are external systems and do not send native telemetry to the Mist Cloud—they only interact through authentication or logging integrations.

NEW QUESTION # 59

What happens to the captured data after a packet capture is stopped or completed?

- A. It is automatically discarded due to limited storage space.
- **B. It is saved as a downloadable capture file for offline inspection.**
- C. It remains permanently in the cloud for continuous analysis.
- D. It triggers alerts based on detected issues within the captured traffic.

Answer: B

Explanation:

The packet capture feature in Juniper Mist Cloud allows administrators to remotely capture live network traffic from managed devices such as Access Points (APs) or switches for detailed troubleshooting.

According to the Juniper Mist Network Troubleshooting and Diagnostics Guide:

"Once a packet capture session is stopped or completed, the captured data is saved as a downloadable .pcap file that can be analyzed offline using tools such as Wireshark." This ensures administrators can inspect packet-level details for issues such as authentication failures, DHCP errors, or connectivity drops. The data is stored temporarily and made available through the Mist UI for download before automatic cleanup.

Options B, C, and D are incorrect because captured data is not stored permanently in the cloud, does not trigger automated alerts, and is not discarded immediately. The purpose is to make the data accessible for offline inspection and analysis.

Therefore, the correct answer is A. It is saved as a downloadable capture file for offline inspection.

NEW QUESTION # 60

What is used in Wireless Assurance to evaluate information about possible network faults?

- **A. machine learning**
- B. SNMP
- C. syslog analysis
- D. tcpdump

Answer: A

Explanation:

Machine Learning in Wireless Assurance: Mist's Wireless Assurance uses machine learning to analyze telemetry data and identify potential network issues. This approach allows for proactive identification and resolution of faults, improving overall network reliability and performance.

NEW QUESTION # 61

What are two solutions that Juniper Mist Location Services provide? (Choose two.)

- A. wayfinding
- B. geofencing
- C. asset location
- D. GPS location

Answer: A,C

Explanation:

Juniper Mist Location Services provide asset location and wayfinding. According to official Juniper documentation: "Juniper Mist provides location accuracy for wayfinding, asset visibility, and user engagement," leveraging cloud-native vBLE and Wi-Fi technologies.

* Asset location enables organizations to locate high-value resources, personnel, or IoT devices in real time with rich analytics, making it easy to find assets and people using the Mist dashboard and APIs.

* Wayfinding gives users turn-by-turn indoor navigation and mapping via mobile SDKs and the Mist cloud. While geofencing can be achieved as part of location-based engagement features, it is not listed as a primary Mist Location Service solution. GPS location is not directly supported; Mist Location Services operate indoors using Wi-Fi and BLE signals, not satellite GPS.

NEW QUESTION # 62

Which two wired elements would be configured using an organization-level template? (Choose two.)

- A. VLAN
- B. host name
- C. role
- D. DNS settings

Answer: A,D

Explanation:

Two wired elements configured using an organization-level template in Juniper Mist are VLAN and DNS settings. Organization-level templates are designed to standardize and propagate common settings across all switches within an organization. As per official guides: "These templates can include VLANs and well-known services such as DNS (Domain Name System) that can be used across all devices within a site." VLAN and DNS settings are defined once at the organization (or switch group) template and automatically inherited by all devices, ensuring consistency. Host name and role are set at an individual switch level, not globally via templates.
