Juniper Junos, Associate (JNCIA-Junos) Sample Questions (Q34-Q39):

NEW QUESTION # 34

What is the protocol data unit (PDU) of the Data Link Layer?

- A. byte
- **B. frame**
- C. bit
- D. segment

Answer: B

Explanation:

In the OSI model, the Data Link Layer is responsible for node-to-node delivery of data. It frames the packets received from the Network Layer and prepares them for physical transmission. The Protocol Data Unit (PDU) for the Data Link Layer is called a "frame." Frames encapsulate the network layer packets, adding a header and a trailer that include the hardware addresses of the source and destination, among other things, facilitating the data link layer services like frame synchronization, flow control, and error checking.

NEW QUESTION # 35

Which layer of the OSI model contains the IP address information?

- A. Layer 4
- **B. Layer 3**
- C. Layer 2
- D. Layer 1

Answer: B

Explanation:

The OSI (Open Systems Interconnection) model is a conceptual framework used to understand network interactions in seven distinct layers. IP (Internet Protocol) addresses are part of Layer 3, known as the Network Layer. This layer is responsible for packet forwarding, including routing through intermediate routers, and it handles the logical addressing scheme of the network to ensure that packets can be routed across multiple networks and reach their destination. IP addresses provide unique identifiers for network interfaces, allowing for communication between devices on a network or across different networks.

NEW QUESTION # 36

Which command displays all IPv6 routes in the default routing instance?

- **A. showroute table inet6.0**
- B. showroute table inet.1
- C. showroute table inet.0
- D. showroute table inet6.1

Answer: A

Explanation:

In Junos OS, the command to display IPv6 routes in the default routing instance is `show route table inet6.0`.

The routing table `inet6.0` specifically holds IPv6 routes. The command `show route table inet.0` is used for IPv4 routes, and `inet6.1` or `inet.1` (assuming `inet.1` is a typo for `inet.1`) are not standard Junos routing tables for displaying IPv6 routes in the default routing instance.

NEW QUESTION # 37

Exhibit

```
[edit system archival] user@router# show configuration {
transfer-on-commit; archive-sites {
"scp://user@172.15.100.2 : /archive" password ## SECRET-DATA
```

"ftp://user@10.210.9.178:/archive" password "\$9..."; ## SECRET-DATA

Referring to the exhibit, where are the configuration backup files stored?

- A. Files are stored to any site as selected by Junos internally.
- B. Files are stored to the SCP site but if the transfer fails, then to the FTP site.
- C. Files are stored to the SCP site and the FTP site in a round-robin manner.
- **D. Files are stored to the SCP site and the FTP site simultaneously.**

Answer: D

Explanation:

In Junos OS, the archival configuration under [edit system] allows for the automatic backup of configuration files to designated locations upon commit. When multiple archive-sites are specified, as shown in the exhibit with both SCP and FTP sites listed, the device does not choose between them or use them in a round-robin manner. Instead, it attempts to transfer the configuration backup files to all specified sites simultaneously upon each commit. This ensures redundancy and increases the likelihood that a backup will be successfully stored even if one of the transfer methods or destinations fails.

NEW QUESTION # 38

Which character is used to filter the command output in the Junos CLI?

- A. >
- B. <
- C. ?
- **D. |**

Answer: D

Explanation:

In the Junos CLI, the pipe character | is used as a filter operator to refine command output. This operator can be combined with various filtering commands like match, except, count, etc., to display only the relevant portions of the command output. For example, using | match <pattern> filters the output to show only the lines that contain the specified pattern, making it easier to find specific information within extensive command output. This functionality is especially useful in managing and troubleshooting complex configurations and network states, allowing for more efficient analysis of the device's operational status and configuration details.
