Juniper JN0-214 Test Dumps, Practice JN0-214 Exams Free
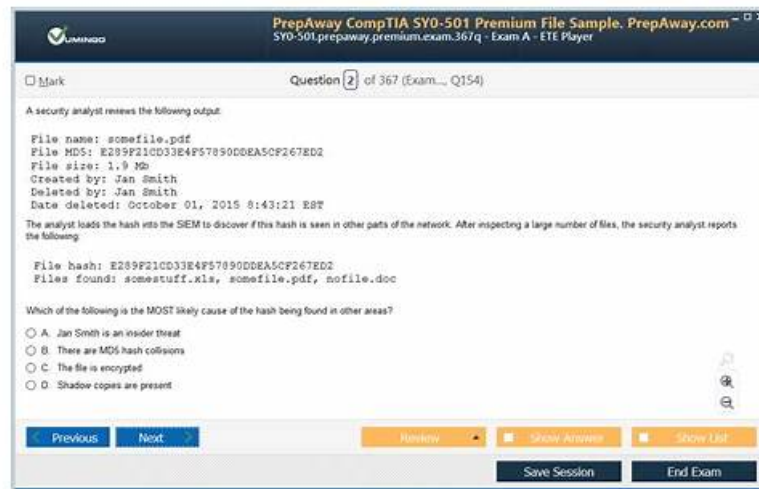

It means you can use the Cloud, Associate (JNCIA-Cloud) (JN0-214) PDF version of itPass4sure anywhere at any time on the smart device you have. Our team of professionals continuously updates the collection of Juniper JN0-214 PDF Questions according to changes in the real test's content. Due to these regular updates, you will get a better experience.

The Juniper JN0-214 certification is on trending nowadays, and many Juniper aspirants are trying to get it. Success in the Cloud, Associate (JNCIA-Cloud) (JN0-214) test helps you land well-paying jobs. Additionally, the Juniper JN0-214 certification exam is also beneficial to get promotions in your current company. But the main problem that every applicant faces while preparing for the JN0-214 Certification test is not finding updated Juniper JN0-214 practice questions.

Practice Juniper JN0-214 Exams Free & JN0-214 Authorized Test Dumps

itPass4sure beckons exam candidates around the world with our attractive characters. Our experts made significant contribution to their excellence. So we can say bluntly that our JN0-214 simulating exam is the best. Our effort in building the content of our JN0-214 study materials lead to the development of learning guide and strengthen their perfection. To add up your interests and simplify some difficult points, our experts try their best to design our JN0-214 Study Material and help you understand the JN0-214 learning guide better.

Juniper JN0-214 Exam Syllabus Topics:

Topic	Details
Topic 1	• Cloud Fundamentals: This section of the exam measures the skills of Cloud Infrastructure Engineers and covers the fundamental concepts of cloud networking. Candidates must understand different deployment models such as public, private, and hybrid cloud, as well as service models such as SaaS, IaaS, and PaaS. The exam also tests knowledge of cloud-native architectures, automation tools, and infrastructure technologies, including Network Functions Virtualization (NFV) and Software-Defined Networking (SDN). One key skill assessed is identifying appropriate cloud deployment models for different business needs.
Topic 2	• Linux Containers: This section of the exam measures the skills of Containerization Specialists and covers the concepts of Linux containers. Candidates must understand the differences between virtual machines and containers, as well as container components. The exam tests the ability to create and manage containers using Docker. One key skill assessed is deploying and managing containers efficiently.

Topic 3	• Network Functions Virtualization: This section of the exam measures the skills of Virtualization Specialists and covers the core principles of NFV. Candidates will be tested on NFV architecture, orchestration, and Virtual Network Functions (VNFs), which are crucial for creating scalable and flexible network infrastructures. Understanding NFV helps optimize network performance and reduce dependency on hardware-based solutions. One skill assessed is the ability to explain NFV's role in modern network management.
Topic 4	• Cloud Orchestration with OpenShift: This section of the exam measures the skills of DevOps Engineers and focuses on OpenShift-based orchestration. Candidates must understand how to create, manage, and monitor workloads using OpenShift, as well as navigate the OpenShift CLI and WebUI. The exam also tests knowledge of node types and different network configurations. One skill assessed is managing OpenShift workloads in a production environment.
Topic 5	• Cloud Orchestration with Kubernetes: This section of the exam measures the skills of Kubernetes Administrators and tests their knowledge of container orchestration. Candidates must demonstrate proficiency in creating and managing Kubernetes containers, working with API objects such as Pods, ReplicaSets, Deployments, and Services, and configuring namespaces and CNI plugins. One key skill assessed is deploying and scaling Kubernetes applications effectively.
Topic 6	• Cloud Orchestration with OpenStack: This section of the exam measures the skills of Cloud Operations Engineers and evaluates expertise in OpenStack-based orchestration. Candidates must understand how to create and manage virtual machines in OpenStack, use HEAT templates for automation, and navigate OpenStack interfaces. The exam also covers OpenStack networking plugins and security groups. One skill assessed is automating cloud deployments using HEAT templates.
Topic 7	• Software-Defined Networking: This section of the exam measures the skills of Network Automation Engineers and focuses on SDN concepts, including its architecture, controllers, and solutions. Candidates must understand how SDN separates the control plane from the data plane to improve network agility and automation. The exam also evaluates knowledge of SDN's role in modern cloud environments. One key skill assessed is identifying SDN components and their functions.

Juniper Cloud, Associate (JNCIA-Cloud) Sample Questions (Q23-Q28):

NEW QUESTION # 23
You want to view pods with their IP addresses in OpenShift.
Which command would you use to accomplish this task?

- A. oc get pods
- B. oc get pods -o yaml
- C. oc get all
- D. oc get pods -o wide

Answer: D

Explanation:
To view pods with their IP addresses in OpenShift, you would use the command oc get pods -o wide. This command provides additional information such as the IP address and the node where the pod is located.

NEW QUESTION # 24
Which two statements are true about virtual networks? (Choose two.)

- A. Virtual networks are available on common Linux distributions.

- **B. Virtual networks are able to span multiple devices.**
- C. Virtual networks are available only as part of a cloud orchestration system.
- D. Virtual networks are limited to a single device.

Answer: A,B

Explanation:
Virtual networks are logical networks that are decoupled from the underlying network hardware.
This decoupling allows network administrators to manage their networks independently of the physical network topology. As such, virtual networks can span multiple devices, allowing for a high degree of flexibility and scalability. Furthermore, virtual networks are available on common Linux distributions, allowing for easy deployment and management.

NEW QUESTION # 25
Which statement is correct about a vRouter?

- A. A vRouter can only provide connections to a single tenant's VM.
- B. A vRouter uses logical systems to create individual routing tables for each tenant.
- **C. A vRouter uses virtual routing and forwarding (VRF) instances to create individual routing tables for each tenant.**
- D. A vRouter always provides a direct connection between a tenant VM and the underlay network.

Answer: C

Explanation:
A vRouter uses virtual routing and forwarding (VRF) instances to create individual routing tables for each tenant. A VRF is a logical partition of a router's routing table that allows multiple instances of routing information to coexist on the same router. A vRouter can provide connections to multiple tenants' VMs by using different VRFs for each tenant.

NEW QUESTION # 26
Click to the Exhibit button.
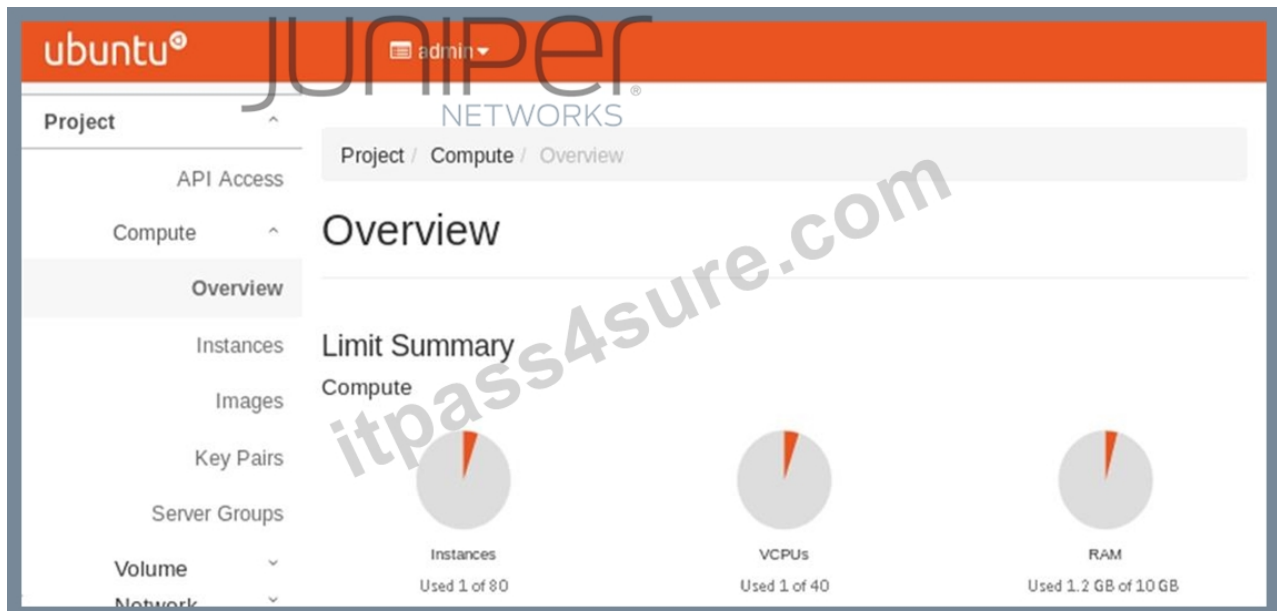

Referring to the exhibit, which OpenStack service provides the UI shown in the exhibit?

- A. Heat
- B. Nova
- **C. Horizon**
- D. Neutron

Answer: C

Explanation:
The UI shown in the exhibit is the OpenStack Horizon dashboard. Horizon is the web-based user interface (UI) for OpenStack,

providing administrators and users with a graphical interface to interact with the cloud environment. Through Horizon, users can manage resources like instances, networks, and storage, which is evident in the displayed metrics (Instances, VCPUs, RAM) for the project.

NEW QUESTION # 27

Which command would you use to see which VMs are running on your KVM device?

- A. VBoxManage list runningvms
- B. virt-install
- C. virsh net-list
- D. virsh list

Answer: D

Explanation:
KVM (Kernel-based Virtual Machine) is a popular open-source virtualization technology that allows you to run virtual machines (VMs) on Linux systems. The virsh command-line tool is used to manage KVM VMs. Let's analyze each option:
A . virt-install
Incorrect: The virt-install command is used to create and provision new virtual machines. It is not used to list running VMs.
B . virsh net-list
Incorrect: The virsh net-list command lists virtual networks configured in the KVM environment. It does not display information about running VMs.
C . virsh list
Correct: The virsh list command displays the status of virtual machines managed by the KVM hypervisor. By default, it shows only running VMs. You can use the --all flag to include stopped VMs in the output.
D . VBoxManage list runningvms
Incorrect: The VBoxManage command is used with Oracle VirtualBox, not KVM. It is unrelated to KVM virtualization.
Why virsh list?
Purpose-Built for KVM: virsh is the standard tool for managing KVM virtual machines, and virsh list is specifically designed to show the status of running VMs.
Simplicity: The command is straightforward and provides the required information without additional complexity.
JNCIA Cloud Reference:
The JNCIA-Cloud certification emphasizes understanding virtualization technologies, including KVM. Managing virtual machines using tools like virsh is a fundamental skill for operating virtualized environments.
For example, Juniper Contrail supports integration with KVM hypervisors, enabling the deployment and management of virtualized network functions (VNFs). Proficiency with KVM tools ensures efficient management of virtualized infrastructure.
