Kubernetes Docs — Admission Controllers: <https://kubernetes.io/docs/reference/access-authn-authz/admission-controllers/>

Sigstore Project (cosign): <https://sigstore.dev/>

Kyverno ImageVerify Policy: <https://kyverno.io/policies/pod-security/require-image-verification/>

Question #7: [Compliance and Security Frameworks]

As a Kubernetes and Cloud Native Security Associate, a user can set up **audit logging** in a cluster. What is the risk of logging every event at the full **RequestResponse** level?

A. No risk, as it provides the most comprehensive audit trail.

B. Increased storage requirements and potential impact on performance.

C. Improved security and easier incident investigation.

D. Reduced storage requirements and faster performance.

Answer: B

★ **Audit logging** records API server requests and responses for security monitoring.

★ The **RequestResponse** level logs the full request and response bodies, which can:

- ★ Significantly increase **storage and performance overhead**.
- ★ Potentially log sensitive data (including Secrets).

★ Therefore, while comprehensive, it introduces risks of performance degradation and excessive log volume.

Question #8: [Kubernetes Threat Model / Multi-Tenancy]

When should soft multitenancy be used over hard multitenancy?

Pass with Valid Exam Questions Pool 6 of 9

We boost the professional and dedicated online customer service team. They are working for the whole day, weak and year to reply the clients' question about our KCSA study question and solve the clients' problem as quickly as possible. If the clients have any problem about the use of our KCSA Exam Practice materials and the refund issue they can contact our online customer service at any time, our online customer service personnel will reply them quickly. So you needn't worry about you will encounter the great difficulties when you use our KCSA test pdf.

One of the great features of our KCSA training material is our KCSA pdf questions. Linux Foundation Kubernetes and Cloud Native Security Associate exam questions allow you to prepare for the real KCSA exam and will help you with the self-assessment. You can easily pass the KCSA exam by using KCSA dumps pdf. Moreover, you will get all the updated KCSA Questions with verified answers. If you want to prepare yourself for the real Linux Foundation Kubernetes and Cloud Native Security Associate exam, then it is one of the most important ways to improve your KCSA preparation level. We provide 100% money back guarantee on all KCSA braindumps products.

Valid KCSA Test Question, KCSA Exam Tips

The aim of Linux Foundation KCSA test torrent is to help you optimize your IT technology and get the KCSA certification by offering the high quality and best accuracy KCSA study material. If you want to pass your KCSA Actual Exam with high score, ActualTorrent KCSA latest exam cram is the best choice for you. The high hit rate of KCSA test practice will help you pass and give you surprise.

Linux Foundation KCSA Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"> Overview of Cloud Native Security: This section of the exam measures the skills of a Cloud Security Architect and covers the foundational security principles of cloud-native environments. It includes an understanding of the 4Cs security model, the shared responsibility model for cloud infrastructure, common security controls and compliance frameworks, and techniques for isolating resources and securing artifacts like container images and application code.
Topic 2	<ul style="list-style-type: none"> Kubernetes Cluster Component Security: This section of the exam measures the skills of a Kubernetes Administrator and focuses on securing the core components that make up a Kubernetes cluster. It encompasses the security configuration and potential vulnerabilities of essential parts such as the API server, etcd, kubelet, container runtime, and networking elements, ensuring each component is hardened against attacks.
Topic 3	<ul style="list-style-type: none"> Platform Security: This section of the exam measures the skills of a Cloud Security Architect and encompasses broader platform-wide security concerns. This includes securing the software supply chain from image development to deployment, implementing observability and service meshes, managing Public Key Infrastructure (PKI), controlling network connectivity, and using admission controllers to enforce security policies.
Topic 4	<ul style="list-style-type: none"> Kubernetes Security Fundamentals: This section of the exam measures the skills of a Kubernetes Administrator and covers the primary security mechanisms within Kubernetes. This includes implementing pod security standards and admissions, configuring robust authentication and authorization systems like RBAC, managing secrets properly, and using network policies and audit logging to enforce isolation and monitor cluster activity.

Linux Foundation Kubernetes and Cloud Native Security Associate Sample Questions (Q14-Q19):

NEW QUESTION # 14

How can a user enforce the Pod Security Standard without third-party tools?

- A. It is only possible to enforce the Pod Security Standard with additional tools within the cloud native ecosystem.
- B. No additional measures have to be taken to enforce the Pod Security Standard.
- **C. Use the PodSecurity admission controller.**
- D. Through implementing Kyverno or OPA Policies.

Answer: C

Explanation:

* The PodSecurity admission controller (built-in as of Kubernetes v1.23+) enforces the Pod Security Standards (Privileged, Baseline, Restricted).

* Enforcement is namespace-scoped and configured through namespace labels.

* Incorrect options:

* (A) Kyverno/OPA are external policy tools (useful but not required).

* (C) Not true, PodSecurity admission provides native enforcement.

* (D) Enforcement requires explicit configuration, not automatic.

References:

Kubernetes Documentation - Pod Security Admission

CNCF Security Whitepaper - Policy enforcement and admission control.

NEW QUESTION # 15

A cluster is failing to pull more recent versions of images from k8s.gcr.io. Why may this be?

- A. There is a network connectivity issue between the cluster and k8s.gcr.io.
- **B. The container image registry k8s.gcr.io has been deprecated.**
- C. The authentication credentials for accessing k8s.gcr.io are incorrectly scoped.

- D. There is a bug in the container runtime or the image pull process.

Answer: B

Explanation:

- * k8s.gcr.io was the historic Kubernetes image registry.
- * It has been deprecated and replaced with registry.k8s.io.
- * Exact extract (Kubernetes Blog):
- * "The k8s.gcr.io image registry will be frozen from April 3, 2023 and fully deprecated. All Kubernetes project images are now served from registry.k8s.io."
- * Pulling newer versions from k8s.gcr.io fails because the registry no longer receives updates.

References:

Kubernetes Blog - Image Registry Update: <https://kubernetes.io/blog/2023/02/06/k8s-gcr-io-freeze-announcement/>

NEW QUESTION # 16

An attacker compromises a Pod and attempts to use its service account token to escalate privileges within the cluster. Which Kubernetes security feature is designed to limit what this service account can do?

- **A. Role-Based Access Control (RBAC)**
- B. NetworkPolicy
- C. RuntimeClass
- D. PodSecurity admission

Answer: A

Explanation:

- * When a Pod is created, Kubernetes automatically mounts a service account token that can authenticate to the API server.
- * The Role-Based Access Control (RBAC) system defines what actions a service account can perform.
- * By carefully restricting Roles and RoleBindings, administrators limit the blast radius of a compromised Pod.
- * Incorrect options:
- * (A) PodSecurity admission enforces workload-level security settings but does not control API access.
- * (B) NetworkPolicy controls network communication, not API privileges.
- * (D) RuntimeClass selects container runtimes, unrelated to privilege escalation through API tokens.

References:

Kubernetes Documentation - Using RBAC Authorization

CNCF Security Whitepaper - Identity & Access Management: limiting lateral movement by constraining service account permissions.

NEW QUESTION # 17

Why does the default base64 encoding that Kubernetes applies to the contents of Secret resources provide inadequate protection?

- A. Base64 encoding relies on a shared key which can be easily compromised.
- B. Base64 encoding is not supported by all Secret Stores.
- C. Base64 encoding is vulnerable to brute-force attacks.
- **D. Base64 encoding does not encrypt the contents of the Secret, only obfuscates it.**

Answer: D

Explanation:

- * Kubernetes stores Secret data as base64-encoded strings in etcd by default.
- * Base64 is not encryption- it is a simple encoding scheme that merely obfuscates data for transport and storage. Anyone with read access to etcd or the Secret manifest can easily decode the value back to plaintext.
- * For actual protection, Kubernetes supports encryption at rest (via encryption providers) and external Secret management (Vault, KMS, etc.).

References:

Kubernetes Documentation - Secrets

CNCF Security Whitepaper - Data protection section: highlights that base64 encoding does not protect data and encryption at rest is recommended.

NEW QUESTION # 18

A cluster administrator wants to enforce the use of a different container runtime depending on the application a workload belongs to.

- A. By modifying the kube-apiserver configuration file to specify the desired container runtime for each application.
- B. By manually modifying the container runtime for each workload after it has been created.
- C. By configuring a validating admission controller webhook that verifies the container runtime based on the application label and rejects requests that do not comply.
- D. By configuring a mutating admission controller webhook that intercepts new workload creation requests and modifies the container runtime based on the application label.

Answer: D

Explanation:

- * Kubernetes supports workload-specific runtimes via `RuntimeClass`.
- * A mutating admission controller can enforce this automatically by:
 - * Intercepting workload creation requests.
 - * Modifying the Pod spec to set `runtimeClassName` based on labels or policies.
- * Incorrect options:
 - * (A) Manual modification is not scalable or secure.
 - * (B) kube-apiserver cannot enforce per-application runtime policies.
 - * (C) A validating webhook can only reject, not modify, the runtime.

References:

Kubernetes Documentation - `RuntimeClass`

CNCF Security Whitepaper - Admission controllers for enforcing runtime policies.

NEW QUESTION # 19

.....

ActualTorrent's KCSA exam certification training materials are not only with high accuracy and wide coverage, but also with a reasonable price. After you buy our KCSA certification exam training materials, we also provide one year free renewable service for you. We promise, when you buy the KCSA Exam Certification training materials, if there are any quality problems or you fail KCSA certification exam, we will give a full refund immediately.
