New 1z1-076 Dumps Sheet, Valid Dumps 1z1-076 Ebook

As you can find that on our website, we have three versions of our 1z1-076 study materials for you: the PDF, Software and APP online. The PDF can be printable. While the Software and APP online can be used on computers. When you find it hard for you to learn on computers, you can learn the printed materials of the 1z1-076 Exam Questions. What is more, you absolutely can afford for the three packages. The price is set reasonably. And the Value Pack of the 1z1-076 practice guide contains all of the three versions with a more favourable price.

Oracle 1z1-076 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none">Enhanced Client Connectivity in a Data Guard Environment: This topic focuses on enhancing client connectivity in a Data Guard setup and implementing failover procedures for seamless client redirection. It also covers application continuity to ensure uninterrupted operations during role transitions.
Topic 2	<ul style="list-style-type: none">Creating a Logical Standby Database: This topic guides users through the process of creating and managing a logical standby database, including SQL Apply filtering.
Topic 4	<ul style="list-style-type: none">Oracle Data Guard Basics: This topic covers the essential architecture and concepts of Oracle Data Guard. It includes sub-topics such as the physical and logical standby database comparison, benefits of Data Guard, and its integration with multi-tenant databases.

Topic 5	<ul style="list-style-type: none"> Managing Physical Standby Files After Structural Changes on the Primary Database: The topic covers managing structural changes in the primary database and their impact on physical standby files.
Topic 6	<ul style="list-style-type: none"> Creating a Data Guard Broker Configuration: This section delves into the practical aspects of creating and managing a Data Guard broker configuration, including command-line and Enterprise Manager approaches.
Topic 7	<ul style="list-style-type: none"> Backup and Recovery Considerations in an Oracle Data Guard Configuration: In this topic, Backup and recovery procedures in a Data Guard configuration are discussed, including RMAN backups, offloading to physical standby, and network-based recovery.
Topic 8	<ul style="list-style-type: none"> Patching and Upgrading Databases in a Data Guard Configuration: This section provides guidance on patching and upgrading databases in a Data Guard environment, along with performance optimization techniques and monitoring considerations.
Topic 10	<ul style="list-style-type: none"> Managing Oracle Net Services in a Data Guard Environment: The section focuses on Oracle Net Services and its role in Data Guard networking setup.
Topic 11	<ul style="list-style-type: none"> Monitoring a Data Guard Broker Configuration: The topic covers the use of Enterprise Manager and DGMGRL to monitor Data Guard configurations and explains the various data protection modes available.
Topic 12	<ul style="list-style-type: none"> Using Flashback Database in a Data Guard Configuration: This topic covers the configuration and advantages of using Flashback Database in a Data Guard setup, as well as the process of enabling fast-start failover for seamless role changes.

Oracle Database 19c: Data Guard Administration Sample Questions (Q48-Q53):

NEW QUESTION # 48

Which four factors can influence the rate of SQL apply on a logical standby database?

- A. the number of applier processes
- B. the size of the undo tablespace on the logical standby database
- C. the size of the shared pool
- D. the number of PREPARER processes
- E. the number of full table scans performed by SQL apply
- F. the number of coordinator processes on the standby database instance

Answer: A,D,E,F

Explanation:

The rate of SQL apply on a logical standby database can be influenced by:

A: The number of PREPARER processes (which seems to be a typographical error and should read as PREPARER or similar) which prepare the redo data for the applier processes.

B: The number of coordinator processes on the standby database instance which coordinate the SQL apply activities.

C: The number of full table scans performed by SQL apply since full table scans can be resource-intensive and slow down the apply rate.

E: The number of applier processes which apply the redo data to the logical standby database.

Option D is incorrect as the size of the undo tablespace on the logical standby database is more likely to affect the SQL apply lag rather than the rate of SQL apply.

Option F is incorrect because the size of the shared pool would typically not influence the rate of SQL apply. The shared pool is more related to the caching of shared SQL and PL/SQL code and control structures.

NEW QUESTION # 49

Which two steps must be performed before running DUPLICATE TARGET DATABASE FOR STANDBY using RMAN?

- A. Create a standby control file.

- B. Create an SPFILE for the standby database.
- C. Run the nid utility to modify the DBID of the primary database.
- D. Transfer a copy of the password file from the primary host to the standby host.
- E. Configure Oracle Net connectivity between the primary host and the standby host.

Answer: D,E

NEW QUESTION # 50

Which two are true about database roles in an Oracle Data Guard configuration?

- A. A Snapshot Standby Database can be a fast-start failover target.
- B. A Logical Standby Database can cascade redo to a terminal destination.
- C. A configuration consisting only of a primary and one or more physical standby databases can support a rolling release upgrade.
- D. A Physical Standby Database can be converted into a Logical Standby Database.
- E. A Logical Standby Database can be converted to a Snapshot Standby Database.

Answer: C,D

Explanation:

A Physical Standby Database can indeed be converted into a Logical Standby Database, providing flexibility in a Data Guard configuration. This allows for the database to switch roles and supports SQL apply operations, enabling more granular control over the data and transactions being replicated and applied. Additionally, having a configuration with a primary database and one or more physical standby databases allows for rolling upgrades to be performed. This means that each database in the Data Guard configuration can be upgraded in a phased manner, minimizing downtime and ensuring high availability during the upgrade process.

NEW QUESTION # 51

Which feature is available when monitoring a Data Guard configuration using Enterprise Manager Cloud Control, but is not available using DGMGRL or by using SQL?

- A. Performing a verify operation
- B. Analyzing the dmon process trace file
- C. Creating a broker configuration before creating the databases
- D. Viewing a logical standby database apply lag
- E. Automatic creation of standby redo logs

Answer: D

NEW QUESTION # 52

Examine this list of possible steps:

1. Raise the compatibility level on both databases.
2. Restart SQL Apply on the upgraded logical standby database.
3. Start SQL Apply on the old primary database.
4. Perform a Switchover to the logical standby database.
5. Upgrade the logical standby database.
6. Upgrade the old primary database.

Which is the minimum number of steps in the correct order, to perform a rolling release upgrade of a data guard environment using an existing logical standby database and to enable the new functionality?

- A. 5,2,4,1
- B. 1,5,2,4,6,3
- C. 4,6,5,2,3,1
- D. 5,2,4,6,3,1
- E. 5,2,4,3,6,1

Answer: B

Explanation:

The process of performing a rolling release upgrade in a Data Guard environment using a logical standby database generally involves these steps:

- * Raise the compatibility level on both databases (1): Ensuring both the primary and logical standby databases are operating with the same and correct compatibility level is essential before starting the upgrade process.
 - * Upgrade the logical standby database (5): Apply the database upgrade to the logical standby first, which allows the primary database to continue serving the workload without interruption.
 - * Restart SQL Apply on the upgraded logical standby database (2): Once the logical standby has been upgraded, SQL Apply must be restarted to apply the redo data from the primary database, which is still running the earlier version.
 - * Perform a switchover to the logical standby database (4): After confirming that the logical standby database is successfully applying redo data, perform a switchover to make it the new primary database.
 - * Upgrade the old primary database (6): With the new primary database now in place, upgrade the old primary database (which is now the new standby) to the new Oracle Database release.
 - * Start SQL Apply on the old primary database (3): Finally, start SQL Apply on what is now the standby database to synchronize it with the new primary database.
