Answer: B

NEW QUESTION # 47

The characteristic of the precedence diagramming method that models construction projects differently than the arrow diagramming method is that it _____.

- A. uses arrows to signify logic in a network
- B. can be used to calculate the late start and late finish of all activities
- C. allows more than one critical path to be represented
- **D. allows multiple relationship types to be associated with activities**

Answer: D

Explanation:

* Precedence Diagramming Method (PDM):

PDM allows for Start-to-Start (SS), Finish-to-Start (FS), Start-to-Finish (SF), and Finish-to-Finish (FF) relationships between activities.

This flexibility makes PDM distinct from Arrow Diagramming Method (ADM), which uses arrows to depict dependencies.

* Evaluation of Options:

Option A: Incorrect. This describes ADM, not PDM.

Option B: Incorrect. Both PDM and ADM can represent multiple critical paths.

Option C: Incorrect. Late start and finish calculations apply to both methods.

Option D: Correct. PDM uniquely allows multiple relationship types.

NEW QUESTION # 48

The primary determination of schedule detail is:

- A. The frequency of update periods
- B. The number of subcontractors working on a work package
- C. The staffing of planners and schedulers
- **D. The contract specifications**

Answer: D

NEW QUESTION # 49

Each of the following accurately describes total float in a schedule EXCEPT:

- A. Can be positive or negative.
- **B. The amount of time an activity can be delayed without delaying the start or occurrence of any other activity or event in the network.**
- C. The amount of time an activity can be delayed without delaying the overall project completion time.
- D. Computed for an activity by subtracting its early finish from its late finish, or its early start from its late start.

Answer: B

Explanation:

Total float measures the flexibility in an activity's timing within a schedule. It is defined as the amount of time an activity can be

delayed without affecting the project's overall completion date or the completion date of any of its successors.

Option A, B, and D accurately describe total float: it is calculated as the difference between early and late start/finish dates, can be positive or negative, and is associated with project completion.

Option C describes free float, not total float, and thus is incorrect.
