CompTIA Advanced Security Practitioner (CASP+) Exam Sample Questions (Q148-Q153):

NEW QUESTION # 148

A cloud security architect has been tasked with selecting the appropriate solution given the following:

- The solution must allow the lowest RTO possible.
- The solution must have the least shared responsibility possible.
- Patching should be a responsibility of the CSP.

Which of the following solutions can BEST fulfil the requirements?

- A. Private
- B. PaaS
- C. IaaS
- **D. SaaS**

Answer: D

Explanation:

SaaS, or software as a service, is the solution that can best fulfill the requirements of having the lowest RTO possible, the least shared responsibility possible, and patching as a responsibility of the CSP. SaaS is a cloud service model that provides users with access to software applications hosted and managed by the CSP over the internet. SaaS has the lowest RTO (recovery time objective), which is the maximum acceptable time for restoring a system or service after a disruption, because it does not require any installation, configuration, or maintenance by the users. SaaS also has the least shared responsibility possible because most of the security aspects are handled by the CSP, such as patching, updating, backup, encryption, authentication, etc.

NEW QUESTION # 149

A security manager is creating a standard configuration across all endpoints that handle sensitive data. Which of the following techniques should be included in the standard configuration to ensure the endpoints are hardened?

- A. Event logging
- B. Patch management
- C. Resource monitoring
- **D. Drive encryption**

Answer: D

Explanation:

Drive encryption protects sensitive data at rest by ensuring unauthorized access cannot expose the data if the physical endpoint is compromised.

Patch management is a necessary security control but does not specifically address endpoint hardening for sensitive data.

Event logging aids in monitoring and incident detection but does not directly harden endpoints.

Resource monitoring manages system performance and availability but is unrelated to data security.

NEW QUESTION # 150

An attack team performed a penetration test on a new smart card system. The team demonstrated that by subjecting the smart card to high temperatures, the secret key could be revealed.

Which of the following side-channel attacks did the team use?

- A. Differential timing analysis
- **B. Differential fault analysis**
- C. Differential temperature analysis
- D. Differential power analysis

Answer: B

Explanation:

"Differential fault analysis (DFA) is a type of active side-channel attack in the field of cryptography, specifically cryptanalysis. The principle is to induce faults-unexpected environmental conditions-into cryptographic operations, to reveal their internal states."
