CCRN Pediatric Practice Exam
Questions from AACN ALL ANSWERS
100% CORRECT SPRING FALL-
2022/2023 LATEST RATED GRADE A+

To promote effective grieving in a 6-year-old sibling following the death of an infant, the nurse should:

- A) Recommend that the sibling not attend the infant's memorial service
 - B) Encourage the parents to minimize their expression of grief with the sibling
 - C) Explain to the sibling that the infant went to heaven
 - D) Explain to the sibling that thoughts and wishes did not cause the infant's death - Answer: D) Explain to the sibling that thoughts and wishes did not cause the infant's death: At age 6, children may take words literally and because of their egocentrism, they believe that thoughts are all-powerful. They may truly believe they caused the death of their sibling. A simple, honest explanation of why the sibling died is indicated. This intervention is consistent with Caring Processes.
- A) Recommend that the sibling not attend the infant's memorial service: This intervention is not a solution to the problem and will not promote effective grieving for the sibling. It is not consistent with Caring Processes.
- B) Encourage the parents to minimize their expression of grief with the sibling: This intervention will lead to ineffective grieving for the sibling and is not consistent with Caring Processes
- C) Explain to the sibling that the infant went to heaven: This intervention will not address the sibling's problem

A 5-year-old with a history of congenital hydrocephalus and VP shunt placement at four weeks of age is admitted with increased somnolence, decreased appetite, and increased complaints of headache. This morning the child vomited twice. The nurse should anticipate:

- A) The physician ordering lumbar puncture and blood and urine cultures
 - B) the patient having a CT scan followed by possible shunt revision
 - C) Administering mannitol or hypertonic saline
 - D) Administering phenytoin (Dilantin) or fosphenytoin (Cerebyx) - Answer: B) The patient having a CT scan followed by possible shunt revision: This patient is demonstrating signs of increased intracranial pressure. The most likely etiology is malfunction of the VP shunt as a result of blockage or disconnection, which is particularly likely over time as the child grows. The definitive diagnosis is made by a CT scan and a shunt series. Surgical intervention for a shunt revision would be indicated.
- A) The physician ordering lumbar puncture and blood and urine cultures: These interventions will not address the most likely primary problem, which is suspected VP

Professional handles professional affairs.

AACN CCRN-Pediatric (Critical Care Nursing) Certification Exam is a rigorous certification exam designed for pediatric nurses who have a passion for critical care nursing. CCRN-Pediatric exam is offered by the American Association of Critical-Care Nurses (AACN), which is a professional organization dedicated to advancing the practice of critical care nursing. The AACN CCRN-Pediatric Certification Exam is designed to test a nurse's knowledge and skills in caring for critically ill pediatric patients.

AACN Critical Care Nursing Exam Sample Questions (Q33-Q38):

NEW QUESTION # 33

Which of the following behavior of a preschooler indicates that the child is in the stage of initiative?

- A. the child ignores his parents and continues to watch television with other child
- B. the child wants to finish his game of Candyland before his dressing is changed
- C. the child talks to his friends on the telephone and arranges for them to visit
- D. the child cries and has a temper tantrum when he is sent to bed to go to sleep

Answer: B

Explanation:

Explanation: A child who wants to finish his game of Candyland before his dressing is changed is in the stage of initiative. During this stage, a child plays, works and lives to the fullest and feels a real sense of accomplishment and satisfaction in activities. Completing tasks becomes increasingly important. Temper tantrum is a characteristic behavior of a toddler.

NEW QUESTION # 34

A nurse enters the room of Daniel, 2 and a half year old, to administer an oral medication. When he the nurse asked if he is ready to take his medicine, he says, "No!" What would be the most appropriate action?

- A. Give the medication to the mother and request her to give it
- B. Explain to Daniel that the medicine must be taken now
- C. Leave the room and return after 5 minutes then give the medicine
- D. Mix the medication with ice cream or apple juice

Answer: C

Explanation:

Explanation: Since the nurse gave the child a choice about taking the medication, the nurse should comply with the child's answer in order to build or maintain trust. Remember that toddlers do not have an accurate sense of time, leaving the room and coming back later is another episode to the toddler.

NEW QUESTION # 35

Early symptoms of carbon monoxide poisoning include:

- A. Tachycardia and wheezing
- B. Bradycardia and apnea
- C. Bradycardia and headache
- D. Tachycardia and confusion

Answer: D

Explanation:

Carbon monoxide (CO) poisoning results in tissue hypoxia by binding to hemoglobin with greater affinity than oxygen, forming carboxyhemoglobin. The most common early symptoms in children include:

* Tachycardia (due to hypoxic compensatory response)

* Confusion, dizziness, and headache (due to cerebral hypoxia)

Wheezing and bradycardia are not typically early signs.

"Early signs of CO poisoning are neurologic (e.g., confusion) and cardiovascular (e.g., tachycardia) due to hypoxia, even when SpO₂ may appear falsely normal." (Referenced from CCRN Pediatric - Direct Care: Pulmonary, Inhalation Injury and Environmental Exposure)

NEW QUESTION # 36

What should a nurse know once a pediatric client is scheduled for a major operation?

- A. Once insulin is not given preoperatively then it is also not required postoperatively.
- B. It will cause a rise in the blood glucose level postoperatively
- C. Greater danger would come from ketoacidosis
- D. Urine tests will provide gauge of diabetic control after the surgical procedure

Answer: A

Explanation:

Explanation: Stress of a major operation will most likely cause the release of Epinephrine and Glucocorticoids that raise blood glucose levels.

NEW QUESTION # 37

The relationship between the family of a long-term patient and ICU healthcare providers has become strained. A nurse should first:

- A. Discuss the issue with the physician
- B. Rotate assignments among staff members
- C. Suggest the family discuss their concerns with the nurse manager
- D. Arrange a patient care conference with the family

Answer: D

Explanation:

When communication and relationships become strained, the most appropriate first action is to initiate a care conference. This collaborative approach provides a forum for the family and healthcare team to align goals, express concerns, and rebuild trust through structured, clear communication.

"Care conferences serve as a critical strategy to address and resolve family-staff conflict, particularly in long-term ICU stays where emotional fatigue and communication breakdowns are common." (Referenced from CCRN Pediatric - Professional Caring and Ethical Practice: Family-Centered Communication and Collaboration)
