When you choose itPass4sure practice test engine, you will be surprised by its interactive and intelligence features. Cloud Security Alliance online test dumps can allow self-assessment test. You can set the time of each time test with the CCSK online test engine. Besides, the simulate test environment will help you to be familiar with the CCSK Actual Test. With the CCSK test engine, you can practice until you make the test all correct. In addition, it is very easy and convenient to make notes during the study for CCSK real test, which can facilitate your reviewing.

Cloud Security Alliance Certificate of Cloud Security Knowledge (v4.0) Exam Sample Questions (Q193-Q198):

NEW QUESTION # 193

What is a key component of governance in the context of cybersecurity?

- A. Defining roles and responsibilities
- B. Standardizing technical specifications for security control
- C. Defining tools and technologies
- D. Enforcement of the Penetration Testing procedure

Answer: A

Explanation:

A key component of governance in cybersecurity is defining roles and responsibilities. Governance ensures that the right people within an organization are assigned specific duties related to security and that they are held accountable for those responsibilities. This helps establish clear lines of authority and accountability, ensuring that everyone knows what they are responsible for in terms of security practices, policies, and procedures.

While standardizing technical specifications, defining tools and technologies, and enforcing penetration testing are important elements of a cybersecurity strategy, defining roles and responsibilities is essential for overall governance to ensure that security practices are consistently followed.

NEW QUESTION # 194

Which document defines the minimum levels of service availability, security, controls, processes, communications & support?

- A. Standard Operating Procedure(SOP)
- B. Statement of Applicability (SOA)
- C. Service Level agreement(SLA)
- D. Operation level agreement(OLA)

Answer: C

Explanation:

SLA is correct answer here. Operational Level Agreements(OLA) refers to agreements that are done between business units within the organisation. Standard Operating procedure(SOP) as the name suggest refers to procedural document to conduct an activity/process. Statement of Applicability(SOA) is also 27001 compliance document which list all the relevant security controls applied to the organisation.

NEW QUESTION # 195

APIs and web services require extensive hardening and must assume attacks from authenticated and unauthenticated adversaries.

- A. True
- B. False

Answer: A

NEW QUESTION # 196

Code execution environments that run within an operating system, sharing and leveraging resources of that operating system, are known as:

- A. VMs
- B. Nodes
- C. Containers
- D. Host

Answer: C

Explanation:

Containers are code execution environments that run within an operating system(for now), sharing and leveraging resources of that operating system. While a VM is a full abstraction of an operating system, a container is a constrained place to run segregated processes while still utilizing the kernel and other capabilities of the base OS.

NEW QUESTION # 197

Which of the following is a primary benefit of using Infrastructure as Code (IaC) in a security context?

- A. Ad hoc security policies
- B. Automated compliance checks
- C. Manual patch management
- D. Static resource allocation

Answer: B

Explanation:

The correct answer is D. Automated compliance checks.

Infrastructure as Code (IaC) is a key DevSecOps practice where infrastructure configurations are defined and managed through code. In a security context, the primary benefit of using IaC is the ability to automate compliance checks and enforce security best practices consistently across environments.

Key Benefits of IaC in Security:

Automated Compliance: IaC allows for the embedding of security policies directly into configuration scripts. This means that when infrastructure is deployed, it automatically adheres to compliance requirements (like NIST, CIS benchmarks).

Consistency and Repeatability: Since IaC scripts are version-controlled, any configuration changes are tracked, minimizing the risk of configuration drift.

Security by Design: By coding security configurations (like IAM roles, network ACLs, encryption settings), organizations ensure that every deployment meets security standards.

Reduced Human Error: Automating infrastructure provisioning reduces manual errors that can lead to vulnerabilities.

Why Other Options Are Incorrect:

A . Manual patch management: IaC promotes automated and repeatable configurations, reducing the need for manual patching.

B . Ad hoc security policies: IaC encourages standardized and consistent policies rather than ad hoc management.

C . Static resource allocation: IaC is dynamic and scalable, allowing for automatic scaling and configuration management rather than static resource setups.

Real-World Example:

Using tools like Terraform or AWS CloudFormation, organizations can define IAM policies, security group rules, and data encryption settings as part of the infrastructure code. These configurations are then automatically checked for compliance against established policies during deployment.

Security and Compliance in IaC:

Organizations can integrate tools like Terraform Compliance or AWS Config Rules to automatically verify that infrastructure settings align with regulatory requirements and internal security policies.
