Fortinet FCP - Azure Cloud Security 7.4 Administrator Sample Questions (Q14-Q19):

NEW QUESTION # 14

A Linux server was deployed in a protected subnet with a dynamic IP address. A FortiGate VM in the internal subnet provides traffic filtering to it, and you must implement a firewall policy using the IP address of the Linux server. Which feature could help integrate FortiGate using Linux server tags?

- A. Software-defined network (SDN) connector
- B. Service Fabric Cluster
- C. Microsoft Entra ID
- D. Targets Management

Answer: A

Explanation:

The Software-defined network (SDN) connector allows FortiGate to dynamically pull metadata such as tags, IP addresses, and resource groups from Azure resources. This enables automatic policy updates based on dynamic IP changes, such as those of a Linux server in a protected subnet.

NEW QUESTION # 15

Which statement about deploying VMs in a gateway subnet is true?

- A. VMs are required in a gateway subnet
- B. VMs are automatically deployed in a gateway subnet
- C. VMs are not allowed in a gateway subnet
- D. VMs can be deployed in a gateway subnet only after you deploy the VPN Gateway

Answer: C

Explanation:

Azure does not allow the deployment of virtual machines (VMs) in a gateway subnet. The gateway subnet is specifically reserved for Azure VPN Gateway or ExpressRoute Gateway instances, and deploying other resources in it can cause gateway deployment or operation failures.

NEW QUESTION # 16

Which additional features does Azure Firewall Premium offer compared to Azure Firewall Standard?

- A. Enhanced URL filtering and web categories
- B. Advanced DDoS protection and VPN diagnostics
- C. Antivirus detection and AI prevention capabilities
- D. Content filtering and threat intelligence integration

Answer: B

Explanation:

Azure Firewall Premium includes advanced features not available in the Standard tier, such as enhanced URL filtering and web categories, TLS inspection, IDPS (intrusion detection and prevention system), and support for private certificate authorities. These enable more granular and secure traffic inspection and control.

NEW QUESTION # 17

You deployed a FortiGate active-active with ELB/ILB solution using the template from Azure Marketplace. What is the purpose of the inbound NAT rules configured in the external load balancer in this deployment?

- A. To forward the health probes to both FortiGate VMs
- B. To load balance the incoming traffic between both FortiGate VMs
- C. To filter inbound traffic before it reaches the FortiGate instances
- D. To allow administrative access to the FortiGate VMs

Answer: D

Explanation:

In an active-active FortiGate ELB/ILB deployment, the inbound NAT rules configured on the external load balancer are used to allow administrative access (e.g., HTTPS, SSH) to the individual FortiGate VMs. Since the public IP is associated with the load balancer, NAT rules are required to map specific ports to backend FortiGate instances for management access.

NEW QUESTION # 18

What is a limitation of the Network Security Groups (NSGs) in Azure?

- A. NSGs operate at the application layer, limiting their effectiveness in the network layer.
- B. NSGs cannot be applied to individual virtual machines.
- C. NSGs allow the filtering of inbound traffic only.
- **D. NSGs are applied only to vNICs.**

Answer: D

Explanation:

A limitation of NSGs is that they are applied only at the subnet level or to network interfaces (vNICs), not directly to other resources like load balancers or application gateways. This means granular application-layer filtering is not supported, and NSGs primarily operate at Layers 3 and 4.
