Snowflake Certified SnowPro Associate - Platform Certification Sample Questions (Q111-Q116):

NEW QUESTION # 111

A data warehouse contains a table 'ORDERS' with columns 'ORDER ID', 'CUSTOMER ID', 'ORDER DATE', and 'ORDER TOTAL'. You need to optimize a query that frequently retrieves the total order amount for a specific customer within a given date range. Which of the following strategies would be MOST effective in improving query performance?

- A. Create a view that filters the 'ORDERS' table based on the date range.
- B. create an index on the 'ORDER DATE' column.
- C. Cluster the 'ORDERS' table using 'CUSTOMER ID' and 'ORDER DATES'.
- D. Increase the warehouse size to allow for more compute resources.

- E. Create a materialized view that pre-calculates the total order amount for each customer.

Answer: C

Explanation:

Clustering the table on 'CUSTOMER ID' and 'ORDER DATE' is the most effective strategy because it physically organizes the data on disk based on these columns. This allows Snowflake to efficiently retrieve the relevant data for a specific customer and date range, minimizing the amount of data that needs to be scanned. Increasing warehouse size will improve general performance, but clustering optimizes for this specific query. Indexes are not typically used in Snowflake. A materialized view would be good, however, clustering is more effective.

NEW QUESTION # 112

Which of the following statements are true regarding considerations when working with VARIANT data types in Snowflake? (Select all that apply)

- A. VARIANT columns can store data with different schema within the same column.
- B. Snowflake automatically indexes VARIANT columns, eliminating the need for manual index creation.
- C. Data stored in VARIANT columns always consumes less storage space than the equivalent data stored in strongly-typed columns.
- D. Queries on VARIANT columns can be slower than queries on strongly-typed columns because Snowflake needs to infer the data type at runtime.
- E. You can use the operator to cast data extracted from a VARIANT column to a specific data type.

Answer: A,D,E

Explanation:

Option A is correct: Querying VARIANT columns involves runtime type inference, leading to potential performance overhead.

Option C is correct: VARIANT columns are designed to store data with flexible schema. Option D is correct: The operator is used for type casting when extracting data from VARIANT columns. Option B is incorrect: Snowflake does not automatically index VARIANT columns. Option E is incorrect: VARIANT columns can sometimes consume more storage space due to the metadata required to describe the data structure.

NEW QUESTION # 113

A Snowflake table 'ORDERS' contains order data, including a 'ORDER DATE' column of type DATE. You want to load data from a CSV file into this table. The CSV file contains the order date in various formats, such as 'YYYY-MM-DD', 'MM/DD/YYYY', and 'DD.MM.YYYY'. You need to load the data into the 'ORDERS' table while consistently converting all date formats into the 'YYYY-MM-DD' format. Which COPY INTO statement snippet is most appropriate for handling the date format variations?

- A.
- B.
- C.
- D.
- E.

Answer: D

Explanation:

Option E provides the most robust solution by using 'TRY TO DATE' to attempt conversion from multiple possible date formats. If a conversion is successful, it converts DATE to VARCHAR, and if none are successful, it sets the value to NULL. The 'TO VARCHAR' function ensures that output is in 'YYYY-MM-DD' format. Other options may either fail or not handle different date formats correctly. The 'TRANSFORM AS SELECT' clause within the 'COPY INTO' statement provides flexibility in transforming

the input data during the load process. Make sure that stage is set to internal stage when referencing itself.

NEW QUESTION # 114

You are tasked with loading data from a Parquet file into a Snowflake table. The Parquet file contains a column with a timestamp datatype. However, the timestamp values are being incorrectly loaded into Snowflake due to a mismatch in the expected timestamp format. Which approach should you take to address this issue?

- A. Set the 'TIME_ZONE' parameter at the session level before running the 'COPY INTO*' command.
- B. Create a view on top of the Parquet file and apply a 'TO_TIMESTAMP' function with the correct format.
- C. Update the Snowflake table column datatype to TEXT and then CAST the values.
- D. Modify the Parquet file to align with the default Snowflake timestamp format.
- E. Use the 'TIMESTAMP_FORMAT' option within the 'COPY INTO' command with the appropriate format string.

Answer: E

Explanation:

Option B is the most direct and efficient way to handle timestamp format discrepancies. By specifying the 'TIMESTAMP_FORMAT' option within the 'COPY INTO' command, you can instruct Snowflake to parse the timestamp values in the Parquet file using the correct format string.

Option A is less practical as modifying the Parquet file might not always be feasible. Option C is also incorrect because Parquet files cannot be created on views. Option D addresses time zone issues, not format discrepancies. Option E will load them as text, which is not desirable.

NEW QUESTION # 115

You have created a custom role called 'ANALYST_ROLE' in Snowflake. You want to grant this role the ability to create views in the 'REPORTING_SCHEMA' schema of the 'ANALYTICS' database and query these views. Which set of privileges must be granted to the 'ANALYST_ROLE'?

- A.

- B.

- C.

- D.

- E.

Answer: E

Explanation:

To create views, the 'CREATE VIEW' privilege is required on the schema. To query the created views, the 'SELECT' privilege is needed. Using 'ON FUTURE VIEWS' ensures that the role automatically has 'SELECT' privileges on any new views created in that schema. The 'USAGE' privilege is also required on the schema in order to access objects within that schema.
