BCS ISTQB Certified Tester Foundation Level CTFL 4.0 Sample Questions (Q43-Q48):

NEW QUESTION # 43

The whole-team approach:

- **A. promotes the idea that all team members should be responsible for the quality of the product**
- B. is mostly adopted in projects aimed at developing safety-critical systems, as it ensures the highest level of testing independence
- C. is a consensus-based approach that engages the whole team in estimating the user stories
- D. promotes the idea that all team members should have a thorough understanding of test techniques

Answer: A

Explanation:
This answer is correct because the whole-team approach is a way of working in agile projects where all team members share the responsibility for the quality of the product, and collaborate on delivering value to the customer. The whole-team approach involves testers, developers, business analysts, product owners, and other stakeholders in planning, designing, developing, testing, and delivering the product. The whole-team approach fosters communication, feedback, learning, and continuous improvement within the team. NEW QUESTION # 44
Consider the following iteration planning tasks where a tester can provide value:
* Break down user stories into tasks (particularly testing tasks)
* Estimate test effort for all testing tasks
* Identify and refine functional and non-functional aspects of the test object Which ONE of the following tasks should be ADDED to the above list?

- A. Writing testable user stories and acceptance criteria
- B. Planning the testing for the release
- C. Determining the test strategy
- **D. Participating in the detailed risk analysis of user stories and determining their testability**

Answer: D

Explanation:
Comprehensive and Detailed In-Depth Explanation:During iteration planning, testers provide input on risk analysis, testability, and the feasibility of test automation.Participating in risk analysis (B)helps identify areas needing more extensive testing.
* (A) is incorrectbecause the test strategy is usually set at a higher level (project or release level).
* (C) is incorrectas release planning is broader than iteration planning.
* (D) is incorrectsince writing user stories is mainly the responsibility of theproduct owner, though testers contribute to defining acceptance criteria.
Risk-based test prioritizationensures testing efforts are aligned with business needs and software risks.

NEW QUESTION # 45
Which of the following is not an example of a typical content of a test completion report for a test project?

- **A. The test procedures of all test cases that have been executed**
- B. The unexpected test environment downtime that resulted in slower test execution
- C. The additional effort spent on test execution compared to what was planned
- D. The residual risk level if a risk-based test approach was adopted

Answer: A

Explanation:
This answer is correct because the test procedures of all test cases that have been executed are not a typical content of a test completion report for a test project. A test completion report is a document that summarizes the test activities and results at the end of a test project. It usually includes information such as the test objectives, scope, approach, resources, schedule, results, deviations, issues, risks, lessons learned, and recommendations for improvement. The test procedures of all test cases that have been executed are part of the test documentation, but they are not relevant for the test completion report, as they do not provide a high-level overview of the test project outcomes and performance. NEW QUESTION # 46

A test manager decided to skip static testing since he believes bugs can be found easily by doing dynamic testing. Was this decision right or wrong?

- A. The decision was wrong. Ensuring quality mandates that static testing is performed after performing the dynamic testing.
- B. The decision was right. Most of the bugs are easier to identify during the dynamic testing.
- C. The decision was right. Static testing is usually redundant if a product is planned to go through a full- cycle of dynamic testing.
- D. The decision was wrong. Static testing can find defects early in the development process, reducing the overall cost of testing and development

Answer: D

Explanation:
Static testing is a form of testing that does not involve executing the software or system under test. It includes activities such as reviews, inspections, walkthroughs, and analysis of documents, code, and models. Static testing can find defects early in the development process, before they become more expensive and difficult to fix in later stages. Static testing can also improve the quality of the software or system by preventing defects from being introduced in the first place. Static testing can complement dynamic testing, which involves executing the software or system under test and checking the results against expected outcomes. Dynamic testing can find defects that static testing may miss, such as performance, usability, or integration issues.
However, dynamic testing alone is not sufficient to ensure quality, as it may not cover all possible scenarios, inputs, or paths. Therefore, a test manager who decides to skip static testing is making a wrong decision, as he or she is ignoring the benefits of static testing and relying solely on dynamic testing, which may not be effective or efficient enough to find and prevent defects. NEW QUESTION # 47

Which of the following statements about the test pyramid is TRUE?

- A. Each layer of the test pyramid groups tests related to a single non-functional quality charactenstic.
- B. The higher the layer of the test pyramid, the more production code a single automated test within the layer tends to cover
- C. The higher the layer of the test pyramid, the more isolated a single automated test within the layer tends to be.
- D. The higher the layer of the test pyramid, the more maintainable a single automated test within the layer tends to be

Answer: B

Explanation:
The test pyramid concept suggests that there should be more low-level tests (unit tests) and fewer high-level tests (end-to-end tests).
As we move higher up the pyramid (e.g., from unit tests to integration tests to end-to-end tests), each test covers more production code.
Higher-level tests (like end-to-end) validate larger parts of the application, including multiple units and their interactions.
This aligns with the principle that higher-level tests provide broader coverage but are fewer in number and more expensive to run and maintain.
