New 010-160 Exam Format, Exam 010-160 Book

The objective of the Prep4King is to help 010-160 exam applicants crack the test. It follows its goal by giving a completely free demo of Real 010-160 Exam Questions. The free demo will enable users to assess the characteristics of the Linux Essentials Certificate Exam - version 1.6 exam product.

Lpi 010-160 (Linux Essentials Certificate Exam, version 1.6) is a certification exam that provides a solid foundation for individuals who are interested in pursuing a career in Linux. 010-160 exam is designed for beginners who have little or no experience with Linux and want to learn the basics of operating systems, file systems, and command-line interfaces. 010-160 exam covers a wide range of topics such as Linux installation, package management, file permissions, shells, and scripting.

Lpi 010-160 Exam consists of 40 multiple choice questions, and the test-taker is given 60 minutes to complete it. 010-160 exam is available in several languages, including English, Portuguese, Spanish, German, and Italian. To pass the exam, the test-taker must achieve a minimum score of 500 out of 800.

Lpi Linux Essentials Certificate Exam - version 1.6 Sample Questions (Q76-Q81):

NEW QUESTION # 76
Which of the following DNS record types hold an IP address? (Choose two.)

- A. A
- B. NS
- C. AAAA
- D. CNAME
- E. MX

Answer: A,C

Explanation:
Explanation
The DNS record types that hold an IP address are the A and AAAA records. These records are used to map a domain name to an IP address of the host, which is necessary for establishing a connection between a client and a server. The A record holds a 32-bit IPv4 address, while the AAAA record holds a 128-bit IPv6 address.
For example, the A record for www.example.com could be:
www.example.com. IN A 192.0.2.1
This means that the domain name www.example.com resolves to the IPv4 address 192.0.2.1. Similarly, the AAAA record for www.example.com could be:
www.example.com. IN AAAA 2001:db8::1
This means that the domain name www.example.com resolves to the IPv6 address 2001:db8::1.
The other options are incorrect because:
* NS records are used to specify the authoritative name servers for a domain. They do not hold an IP address, but a domain name of the name server. For example, the NS record for example.com could be:
example.com. IN NS ns1.example.com.
This means that the name server ns1.example.com is authoritative for the domain example.com.
* MX records are used to specify the mail exchange servers for a domain. They do not hold an IP address, but a domain name of the mail server and a preference value. For example, the MX record for example.com could be:
example.com. IN MX 10 mail.example.com.
This means that the mail server mail.example.com has a preference value of 10 for receiving email for the domain example.com.
* CNAME records are used to create an alias for a domain name. They do not hold an IP address, but another domain name that the alias points to. For example, the CNAME record for www.example.com could be:
www.example.com. IN CNAME example.com.
This means that the domain name www.example.com is an alias for the domain name example.com.

NEW QUESTION # 77
What is true about a recursive directory listing?

- A. It includes ownership information for the files.
- B. It includes the permissions of the directory listed.

- C. It includes the content of sub-directories.
- D. It includes details of file system internals, such as inodes.
- E. It includes a preview of content for each file in the directory.

Answer: C

NEW QUESTION # 78
What is the purpose of the PATH environment variable?

- A. It specifies the location of a user's home directory.
- B. It contains the absolute path to the current directory.
- C. It allows the execution of commands without the need to know the location of the executable.
- D. It indicates the location of the default shell to be used when a user logs in.
- E. It increases security by preventing commands from running in certain locations.

Answer: C

Explanation:
Explanation
The PATH environment variable is a special variable that contains a list of directories that the system searches when looking for a command to execute12. The purpose of the PATH variable is to make it easier and faster for users to run commands without having to type the full path to the executable file. For example, if you want to run the ls command, which is located in the /bin directory, you don't have to type /bin/ls every time. You can just type ls, and the system will find the executable file in the /bin directory, which is one of the directories in the PATH variable. The PATH variable can be viewed with the echo command12:
$ echo $PATH
The PATH variable can also be modified by adding or removing directories, either temporarily or permanently, depending on the user's needs12. For example, if you have acustom script or program in your home directory, and you want to run it from anywhere, you can add your home directory to the PATH variable with the export command12:
$ export PATH=$PATH:~/myprogram
This will append your home directory to the end of the PATH variable, and the system will search it last when looking for a command. To make this change permanent, you need to edit a configuration file, such as
~/.bashrc or ~/.profile, and add the export command there12.

NEW QUESTION # 79
What is the UID of the user root?

- A. 0
- B. 1
- C. 2
- D. 3
- E. 4

Answer: A

Explanation:
Explanation
The UID of the user root is always 0 on Linux systems. This is because the kernel uses the UID 0 to check for the superuser privileges and grant access to all system resources. The name of the user account with UID 0 is usually root, but it can be changed or have aliases. However, some applications may expect the name root and not work properly with a different name. The UID 0 is reserved for the root user and cannot be assigned to any other user. The UID 0 is stored in the /etc/passwd file along with other user information. References:
